concern, subject to the ultimate control of the board of trustees. An application to Parliament for a "grant in aid" of at least £1,000 for the purchase of pictures should be made, unfettered by any condition as to an equivalent amount being subscribed by private liberality. These recommendations should come into force immediately as regards the existing National Gallery, and should apply equally to the new National Gallery, included in the recommendations. At the National Portrait Gallery, the same principles should be followed as in the case of the National Gallery, and there should be an annual grant of £200 for the purchase of pictures. A new building should be erected or acquired for the National Gallery. Towards the erection of this building £20,000 should be contributed by the trustees from their accumulated funds, the balance being provided from Imperial funds. When the new National Gallery is erected or acquired, the whole building at present occupied by the National Gallery and Royal Scottish Academy should be handed over to the Royal Scottish Academy, to be used by that body exclusively for art purposes, such as exhibitions of works of art and art education. The existing grant of £200 per annum for five years for the purchase of antiquities should be made permanent. The increased charges that would be put upon the annual votes if these recommendations are adopted would amount in all to the very moderate sum of £4,200.

Mr. G. D. MARTIN, F.S.I., in a letter to the daily Press, expresses his disappointment and regret that the London County Council have abandoned their intention to widen the narrow bottle neck of Sloane-street at the Knightsbridge end, where the properties are about to be rebuilt. Sloane-street, which has a general width of 65ft., is here contracted to 45ft., and Mr. Martin states that the abandonment of the scheme rests solely upon the question of expense of repaving, amounting to the very small sum of, perhaps, £1,000. Surely this cannot, and certainly ought not, to block the way to this important and much-needed improvement, and possibly if the residents and landowners in the neighbourhood feel strongly as to the value and necessity of the widening they will themselves raise this comparatively small sum, and so enable the County Council to go forward.

The Belfast Corporation discussed at their last meeting a report presented by a sub-committee upon a charge of £840 11s. 6d. made by Messrs. H. and J. Martin, and certified by the architect, Mr. Thomas, for erecting a stand at the New City Hall for the ceremony of unveiling the Queen's statue during the recent royal visit. It appeared that the original estimate was £359, but the plans had been slightly altered. The sub-committee declared that the architect's certificate for £840 was in distinct violation of the committee's resolution that Messrs. Stephen, the quantity surveyors, should measure and price the work. Alderman Henderson considered that the report of the sub-committee was unfair, as it attacked the architect, who had not had an opportunity of replying. Councillor Barkley sharply criticised the bona fides of the charge. In the original plan prepared by Mr. Thomas it appeared that he had only provided for 1,050 people on the stand instead of 1,800. A stand had been erected in Bangor to accommodate 2,000 people at a cost of £120, and the sum charged by Messrs. Martin meant about 10s. a seat. The Lord Mayor said as regards the stand, it certainly cost a great deal more than it was intended it should cost, and on this occasion he must say the architect should have consulted the committee before giving his certificate. After the discussion had lasted an hour and the members were waxing eloquent in their determination to resist the heroic charge for the stand, it transpired that the money had been already paid. The Lord Mayor expressed his disapproval of these premature payments, and pointed out that no such cheques ought to issue save with the authority of the corporation. At the same time it appeared that it had been the practice hitherto for the committee to pay what was certified for. The subject then dropped.

At the annual meeting of the American Institute of Architects just held at Cleveland, an address was read by the President, Mr. C. F. McKim, Royal Gold Medallist for the present year, who laid stress on the recent increase and betterment of our schools of architecture in Harvard, Columbia, Pennsylvania, Cornell and Illinois Universities, as well as in the still older

foundation of the Institute of Technology in Boston. Incorporated in the presidential address was a cable message from Mr. Aston Webb, R.A., stating that the Washington Commission Park improvement plans were, in his opinion, as fine as they could be. A resolution of approval of the great and life-long services of Professor Ware, and expressing regret at his withdrawal from active professional work, after having acted as the pioneer and organiser of architectural education in the United States, was unanimously passed.

An architectural curiosity is, says the *American Architect*, to be seen in New York, on ground formerly a part of Alexander Hamilton's farm, Hamilton Grange. The rector of the Roman Catholic parish of Our Lady of Lourdes, finding that his parishioners needed a new church, and had not much money to pay for it, decided to build it out of secondhand materials, of which there happened to be a large supply in the market. The old Academy of Design had just been pulled down, and he secured the black and white marble and the carvings of that structure, and arranged to incorporate them in the new building. Then the marble Stewart House, which once stood on the corner of Fifth Avenue and Thirty-fourth Street, was demolished, and Father McMahon secured the materials of this imposing Renaissance mansion; and, finally, the Archbishop made him a present of the marble of the temporary east end of the cathedral. Naturally, the mixture of the Truth-in-Art Veneto-Florentine Gothic of the Academy of Design with the French 14th-century style of the Cathedral, and these, with the Corinthian pilasters and rusticated corners of the Stewart mansion, give a somewhat peculiar effect; but, as Father McMahon says, those who do not like the outside of the building had better come in and see if what goes on inside will not please them better.

The building boom in Johannesburg is, says the last issue to hand of the *Times of Natal*, at its height. Never before in the history of the city has such an enormous number of buildings been in process of erection at any one time. For the most part the new structures are business premises, designed to meet the enormous expansion which, it is confidently anticipated, will take place before long. The day of flimsy business premises on the Rand has passed. Massive structures of steel, stone, and brick are displacing tin shanties and jerry-built houses, and though one may still see the familiar one-story tin hut nestling under the shadow of a five-storied solidly-built edifice of stone, the process of transition is being hurried swiftly onwards. The latest additions to the business palaces are the two new buildings that occupy the northern corner of Pritchard and Eloff-streets. This, the fashionable business quarter of the town, is rapidly squeezing out the dingy sheds that have so long constituted its chief adornments. With the pressure taken off the railways, and with materials of all kinds coming to hand promptly, building is being pushed forward without delay. Plenty of labour is also available. For £4 per month black labour can be secured in abundance, whilst there is scarcely a job in town that could not secure any day a score of carpenters, bricklayers, and plasterers more than are required for the work in hand. Although there has been no slackening in building operations, there are more skilled workmen to-day seeking employment than is usually the case. At the present time carpenters and bricklayers receive 22s. 6d. per day and plasterers 24s.; foremen in each case receive an additional 4s. to 5s. per day. At the present rentals for houses and the high cost of living, this wage is by no means extravagant. There is, however, a proposal on foot to reduce the wages to £1 per day.

The death is announced of Mr. Arthur Cayton, architect and surveyor, Southend-on-Sea. Trained in the borough surveyor's office at Southport, he was afterwards appointed borough surveyor of Southend, but resigned some years since to practise independently in the latter town.

Earl Roberts unveiled at Windsor on Friday the memorial statue to the late Prince Christian Victor which has been placed at the foot of the Hundred Steps to the Castle. The statue, of bronze, which stands in a niche beneath a carved canopy of Edithweston stone, represents the late Prince in campaign uniform, bareheaded, his sword by his side, and a pair of field-glasses in his hand. The sculptor was Mr. W. Goscombe John, A.R.A., and the architect Mr. J. W. Nutt, M.V.O., of Windsor.

MEETINGS FOR THE ENSUING WEEK.

MONDAY.—Royal Institute of British Architects. "Le Trésor de Coide et les Monuments de l'Art Iouien à Delphes," by Mons. J. T. Homotte. 8 p.m.
Liverpool Architectural Society. "The Bill for Altering the Law of Ancient Lights," by H. Chatfield Clarke.

TUESDAY.—Institution of Civil Engineers. "Tensile Tests of Mild Steel, and the Relation of Elongation to the Size of the Test-Bar," by Prof. W. C. Unwin, F.R.S. 8 p.m.

WEDNESDAY.—Quantity Surveyors' Association. General Meeting to approve memorandum and articles of association and appoint office bearers. Duke's Saloon, Holborn Restaurant. 4 p.m.
Architectural Association. Discussion section. "Practical Travelling on the Continent," by M. G. Pechell. 7.30 p.m.
Society of Arts. Opening Address by Sir William Abney, vice-president. 8 p.m.
St. Paul's Ecclesiastical Society. "The Blednow Inventory of 1781," by Dr. J. Wickham Legg, F.S.A. St. Paul's Chapter House. 8 p.m.

THURSDAY.—Society of Architects. Inaugural Address by the President, Walter W. Thomas, of Liverpool. St. James's Hall, Piccadilly. 8 p.m.
Leeds and Yorkshire Architectural Society. Opening Meeting.

FRIDAY.—Architectural Association. "Farm Buildings," by H. M. Cantley, A.R.I.B.A. 7.30 p.m.
Glasgow Architectural Craftsmen's Society. "Planning and Construction of Burgh Buildings," by James C. Walker. 8 p.m.

THE ARCHITECTURAL ASSOCIATION.

NOVEMBER 20th: ORDINARY GENERAL MEETING at No. 9, Conduit-street, W., at 7.30 p.m. PAPER by Mr. H. M. CANTLEY on "Farm Buildings." LOUIS AMBLER } Hon. Secs.
H. TANNER, Jun. }

CHIPS.

The Croydon Corporation have appointed Mr. W. H. Prescott, engineer and surveyor to the Tottenham Urban District Council, as surveyor of the schools under the education committee at a salary of £150 a year. They have referred to the works committee a letter from Mr. A. E. Pridmore, A.R.I.B.A., for the past five years architect and surveyor to the late Croydon School Board, with reference to the compensation to be given him for loss of office.

Mr. Rushforth has, owing to ill health, resigned the directorship of the British school at Athens. The committee have appointed as his successor Mr. H. Stuart Jones, tutor of Trinity College, Oxford, with Mr. Thomas Ashby as assistant director.

The memorial to the late Dr. Bradley, Dean of Westminster, will take the form of the addition of his portrait to the long series of deans now on the walls of the Deanery.

The ancient church of St. John's, Leeds, built in 1631-3, the finest ecclesiastical building of the city, was reopened on Friday after restoration at a cost of £1,500.

A Local Government Board inquiry was held at Croydon yesterday (Thursday) into the application by the corporation for sanction to borrow £3,550 for works of surface-water drainage at Woodside Green and neighbouring roads, and for concreting a part of Norbury brook; also £13,000 for the erection of a refuse destructor at Brimstone Barn, Factory-lane.

Sir Gerald Raoul de Courcy Perry, Consul General at Antwerp, who died on April 9 last, aged 67 years, has bequeathed portraits of his grandfather and grandmother by Sir Thomas Lawrence to the National Gallery.

St. Clement's Schools, Oxford, are being warmed and ventilated by means of Shorland's patent Manchester stoves, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

Premises situate in Busby-street, Bethnal Green, and used as steam sawmills, workshops, and stores by a number of cabinetmakers, joiners, and timber dealers, were destroyed by fire on Friday. The building belonged to Messrs. Webster, of Bethnal Green-road, and, being sublet for steam-power purposes to a number of tenants, was closely stored with great quantities of timber of every kind.

On All Saints' Day the Dean of Salisbury dedicated a new altar frontal illustrating the "Te Deum." In the centre is a representation of our Lord seated in glory, His right hand raised in blessing, and His left bearing the orb and sceptre; at each of the four corners is an archangel. On either side are four panels, each containing four figures elaborately worked. The frontal has been designed by Mr. S. Gambier Parry, and is the entire work of Mrs. Weigall, with the assistance of her daughter, Mrs. Aldworth, having occupied nearly seven years.

THE BUILDING NEWS

AND ENGINEERING JOURNAL.

VOL. LXXXV.—No. 2550.

FRIDAY, NOVEMBER 20, 1903.

INSTRUCTIONS TO ARCHITECTS.

HOW far an architect is justified in departing from the instructions of his client is a question that can only be answered by considering another question: Whether the instructions are the best or the most reasonable in the circumstances? A professional man is engaged for a special purpose—as, for instance, to design a building which will meet the requirements and satisfy the client; he is not engaged to comply with conditions which are doubtful, or that the client could not accept. That is to say, if the client asked for requirements that were unreasonable, the architect would certainly be to blame if he designed a building to meet such requirements, knowing they were undesirable. In short, no professional man would be bound, legally or morally, to comply with instructions which he knew would be unsatisfactory and cause his client injury; he is employed to bring his knowledge and experience to bear upon the problem for his client's benefit, or otherwise his employment would be useless. If we accept this position or principle as the right one, it follows that a professional man has a discretionary power open to him to depart from his client's "instructions" when he thinks it necessary. But there are two kinds of instructions: those which furnish simply facts and data, which a client would give to his legal adviser; and "instructions," which lay down a course of action or set forth the requirements of a plan, such as those which are given to the architect or competitor before he proceeds to make a design. It will be seen the two kinds of "instruction" are very different—one merely furnishes the necessary particulars, the other suggests a plan or a scheme in certain particulars. It sets forth the accommodation required, the dimensions of rooms, their position, they define positions for certain rooms and entrances, &c. To some extent, instructions in the latter sense are dictatorial or arbitrary, and appear to be undesirable. A medical practitioner or lawyer or engineer would not tolerate such instruction in his professional procedure. A painter or sculptor or any other artist would consider it a gratuitous insult to be instructed in his work. The architect stands in another category. He is not expected to know every business or trade or the habits of his client, and before he can prepare a plan he must learn certain things; he must have certain data as to dimensions and accommodation furnished; his art is one in which the imaginative faculties are not paramount; he has to consider utility and actual requirements, and so to a certain extent is restricted. Before he can make a design for a building he has to listen to his client's wants and tastes or business requirements, and the more thoroughly he can enter into his client's wishes, habits, and mental surroundings, the more successful is he in fulfilling his task. It is not every one who can throw himself heart and soul into the wants of a client, and it is not the letter of the instructions so much as their spirit he has to master. The architect may know better than his client what he really wants and how best to accomplish the work, and it is just this inner meaning which is obscured by instructions. The professional man has to try and master the real meaning and intention of his employer, to do which he must be master of the problem set before him. A formal set of instructions, such as those drawn up by a

committee for competing architects and probably interpreted by an official before they are printed, is often a very loose and incoherent document. It is vague in essential points, and leaves much to the imagination, or, on the other hand, it may be drawn up in so narrow and rigid a manner, that it does not give any scope to the competitor to exercise his own discretion. It may, for instance, define certain requirements and give a schedule of accommodation in superficial feet or dimensions, which cannot be complied with, without the sacrifice of some other condition—for instance, lighting area. At the same time, it may tie the competitor down to a certain cost which may render the scheme impracticable. Several competition conditions we have lately seen have rendered it almost impossible for the competitor to comply with them. Either the accommodation required is larger than can be provided for the cost prescribed, or there is a condition to provide rooms on one floor which is not possible. The competitor is placed in a dilemma: he has to reduce the area of a room or department, or put it on another floor, by which he places himself outside the terms of the competition. The hard-and-fast set of conditions is unfair to those who have something better to offer but are afraid to incur the risk of being rejected. It is equally unjust to those who have been bold enough to exercise their discretion in showing a better way. There is an intermediate class of conditions, those which have been carefully considered and discussed, or which have been drawn up with the assistance of the assessor. No excuse can be offered for non-compliance or for any eccentricity of treatment. While it is obligatory for a competitor to use his "own" judgment in interpreting a vague and insufficient set of instructions; and to adhere closely to the terms of a rigid and hard and fast set; in the latter case he is conscientiously bound to comply with the meaning and spirit of the conditions. Any architect on the very threshold of his design can perceive the reasonableness of the provisions, and he is at liberty to ask any question which may arise in his mind as to any point that he cannot quite understand. A reasonable and well-drawn set of instructions will leave some points to the discretion of the competitor: it will not be too precise in its terms: it will not say that every dimension given is to be rigidly followed; but will make the schedule as far as possible approximate. It will allow the competitors the liberty to modify any arrangement if they deem it necessary, and to adopt a style of architecture suitable. A few recently drawn up conditions based on the recommended form issued by the Institute have been of this kind. The conditions issued by the Acton Urban Council for their New Public Offices are a good example; the Council were assisted by an assessor in drawing up the conditions, and to assist in the selection. There were certain grounds stated on which competitors could be disqualified: for instance, if the conditions and schedule of accommodation are not substantially adhered to; if the design is not the work of the competitor; and if the competitor canvas, directly or indirectly, any member of Council, or reveal his identity. These conditions are reasonable; they are not exacting; the clauses are few and clearly stated, and avoid any overlapping and confusing provisions. As regards cost, no amount is stated, but only the rate per cube foot and what that rate should contain, and how the cubical contents are to be calculated, so that each competitor was left to work out his design upon data of the same kind. Every competitor is thus placed on a level, and the amount of his estimate will show exactly the relative costliness of his design. When competitors are asked to give an estimate of the cost upon their own cubing and rate per foot, there is a strong tendency to make the

latter agree with the amount, whatever the limit of cost may be. Often a rate per cube foot is mentioned that is quite inadequate, or the cubing is taken just as the competitor likes. There can be no uniformity or reliability in these calculations. We have often seen the most elaborate design priced at a lower rate than others of plainer description. By fixing a rate per foot cube that is known to be reasonable, the difference in cost must entirely depend on the cubical contents of the building or the area covered, and there is an inducement to economise area of plan. At the same time the accommodation required ought to be determined, the competitors being allowed to modify the areas specified. The condition as to cost is a very important one, upon which a great deal is made to rest. When a certain sum is stated as the limit of cost, we do not see how any conscientious competitor can depart from the condition. It is a fixed quantity, but it is often difficult for the competitor to cut his design accordingly. The requirements given are, perhaps, impossible to be obtained for the money; the scheme is too large, and the only alternative is to reduce it or to reduce the price per foot, which may be impossible. The more satisfactory mode is to state the rate per foot cube which is a fair price for the building. The competitors are then left to design a building that will contain every requirement. Though this plan does not define the amount to be expended, it encourages the competitor to be economical in the plan, especially if the committee express a desire to select the least costly. There are, in fact, three elements: two may be fixed as the rate per foot cube and the accommodation, and the other, the cost, be left open. When the cost is stated it becomes a fixed quantity, and the other two factors, the accommodation and the rate per foot cube, may vary. The former may be reduced as the price per foot is increased, or *vice versa*. But by fixing the price per foot, and also the accommodation, there cannot be a great variation in the estimates submitted—any difference between the designs will be due to the skill of the architects in providing the accommodation on a smaller area than other competitors. And this plan is the fairest; it enables the designer to devote his best energies to the planning of the building in the most economical manner, for he knows that the smaller the cubical capacity of his design the less costly it will be, and the more he will be able to spend in details and fittings. But when the limit of cost is fixed there is the temptation to undercut, to price portions of the building at a rate which can only mean scamping and inferior work. And yet this latter plan is generally followed in competition conditions, and, as we have said, it is one of the instructions which cannot be safely departed from without injustice to other competitors; while the other method we have noticed, that of fixing a rate per foot cube, allows a little more freedom.

The supplementary instructions often given to competing architects in reply to questions are a proof of the want of clearness of the conditions issued, and the frequent ambiguity of the clauses. For instance, questions as to boundary and limits of land often occur. A competitor sees a great advantage if he can set back his frontage line instead of following the boundary all through, so as to make breaks in his front. A clause, for instance, in a late competition set of conditions stated that the "architects must be guided in their designs by the arrangement shown on the site plan, and, whilst not strictly bound to same, they should keep as near as possible to the principal features." Several questions were asked by competitors, one, whether the front could be brought out in a certain part, another as to what features were intended to be followed, and the answers to those several questions became new instructions; many were in doubt as to the meaning. In

another recent case, a clause stated that "the schedule of accommodation and requirements must be adhered to; but the competitors are at liberty to slightly modify the areas of the various rooms." The interpretation attached to the words "slightly modify" were evidently taken in different senses: the successful competitors (it was a limited competition) actually went so far as to provide only one suite of rooms for kitchen, rooms for dinners and dancing, &c., instead of the two suites asked for. How the words "slightly modify" could be so stretched we do not know. The condition to provide distinct entrances for the public part of the building and the offices is another provision which cannot in fairness be taken to mean only one. But the questions asked by competitors and answered are often such as to so "whittle" down and modify the original instructions to the degree that they become no longer tenable. As far as possible the conditions should be so clear and intelligible as to render any supplementary instructions quite unnecessary. They compromise the position of the promoters. A does not know the exact question which B. has asked, but sees the answer, and probably interprets it in quite another way. B., C., D., &c., ask other questions, and receive answers which put a different construction on the conditions; the result is that practically a modified set of conditions takes the place of the old. In such an instance—we do not say that it is always so—the architect cannot be called upon to implicitly accept the instructions first issued. He must be prepared to exercise an open mind on the instructions.

It seems, therefore, desirable that to promote unanimity among the competitors, the instructions should be definite as far as they go, leaving the competitors free to use an open mind on points that are not mentioned. Such points as site, ancient lights, frontages, entrances, exits, accommodation of an absolute necessary kind, areas of certain rooms, besides instructions as to levels, heights, heating and ventilation, ought to be clearly defined. From these there should be no departure possible; but there are unimportant questions relating to proportion of rooms, the desirability of additional rooms, which rooms should be placed on each floor, questions of arrangement and location of departments and entrances which may be regarded as optional. The main thing is that the chief points absolutely essential should be fixed and unalterable, so that there can be no doubt left in the mind of the most inexperienced competitor as to what is intended. When these are determined, supplementary information and answers to questions that are often not clearly understood are undesirable and provoke dissatisfaction. In both private commissions and public competitions, the client or promoters look to the architect to design something which they are not in a position to do for themselves; in either case he has to use his professional skill and discretion in interpreting the conditions, not simply as a mechanical draughtsman to prepare designs according to a prescription. This latter view of the profession is, however, overlooked. The ordinary employer is apt to regard the architect's function as a merely mechanical one, the output of a number of drawings in accordance with instructions, though at the same time he is held responsible for the result.

NEW ENGLISH ART CLUB.

THE modern pictures on view at the Dalley Gallery, Piccadilly, vary very much in subject and quality. There is the same striving after "modern" or advanced ideas in painting, a great deal of the experimental in the methods adopted, and a few achievements of merit. Taking the collection in the order of the catalogue, we note several

very effective sketches in water colour, pencil, and crayon, a few of the former remind us of the outline sketches of the early water colour artists, like Sandby, Girtin, and others of the school in which the colouring is exceedingly slight, being merely simple washes of local colours or tints. Amongst sketches of this class we may refer to Douglas Robinson's sketch of an old house, "In the Park" (1); Harry Tonks' sketch, "A Golden Evening," in simple tints of yellow ochre and blue, and his equally slight study, "An Autumn Morning" (14), an avenue of trees in the sunlight, very broad and effective in the tints; Francis E. James's "From my Window at Instow," and "Sketch, Instow," the first a river scene between meadows. Other sketches include Alfred W. Rich's "Brighton" (3); D. S. Maccoll's "The Market Church, Richmond, Yorkshire," an outline sketch, but the vertical lines of tower are not true; his delightful little study "Indian Pinks" (15) in a cup; and "The Mill Stream" (21); William Orpen's "The Woman in White" (9), a stormy dark landscape; H. B. Brabazon's "On the Riviera" (11), a "note" of tone; Muirhead Bone's "Moonlight, Melrose," an effective pencil sketch; P. Wilson Steer's broad and vigorous study (19), "The Weir," a work showing depth of tone and power in foliage and sky; Professor Fredk. Brown's "A Waterfall," in this painter's strong, vigorous style; W. W. Russell's "Bridge, Barnard Castle," a sketch with local tints. Some effective work is done by H. Bellingham-Smith (29, 43); Alfred W. Rich, in his solidly-handled landscape, "Storrington Common" (38); Henry Tonks, in his vigorous study "The Storm"; and by Roger E. Fry, "A Village Pub," a reed-pen outlined, tinted sketch. Proceeding up the gallery to the oil pictures, we notice several artists have been painting Yorkshire scenery. W. W. Russell's large sunlit landscape, "Barnard Castle, in Teesdale" (54), is one of the most striking—an expansive valley bathed in sunshine. Mr. Russell suffuses his landscape with a golden radiance. "The Mill Dam" (122) is another work by this painter, equally strong. Professor Fredk. Brown paints with much power, though there is a want of breadth in some of his work. "A View of Richmond, Yorks" (74) is chargeable with this quality. The strong lights, admirable in their way, have no corresponding relation of shadow, and the effect is broken up. Cumulous clouds, through which the sun's rays pierce and light up a landscape, are seen in R. Wilson Steer's powerful work, "Richmond Castle, Yorks" (118), where the flicker of ambient light on castle and trees is realistic. The wild, stormy sky, "loaded" with white pigment, is powerfully painted. "On the Swale," by Professor Brown (58), has the same quality and technique. In fact, the works of P. Wilson Steer, Professor Brown, and W. W. Russell have much in common in their treatment and style. "The Shower," by the first-named (108), is a skilful realisation of sunlight through banks of cloud, the town partially lighted by gleams of golden sunshine. The distance merges into the clouds, giving the sense of falling rain. This, and the same painter's "Richmond Castle," noticed above, are notable works of this master of clouds and atmosphere, whose labours in this direction have been aided by the late wild weather. Max West (59) essays an experiment in "The View," a girl in strong blue dress, sitting on a hillside viewing a wide landscape, the harsh note of the blue coming into strange harmony with the green of the landscape. Sombre in its deep tone and grey light of sky is "The Village Inn" (60), an evening effect by David Muirhead, painted with his usual power, and his bluish-grey landscape, "Autumn." The "River Scene," by D. S. Neave, with profile of St. Paul's dome, as seen from the river, is subdued

and pleasing in colour. W. Rothenstein has again selected for his themes dark-clad figures set against cream or ivory white surfaces. "Mother and Child" (61) is, on the whole, a successful experiment, but we scarcely think so happily treated as it might have been. There is a stiffness in the straight lined back of the chair in which the mother is seated, who holds by his hands her little son on her lap. The blue frock of the child contrasts with the light panelled walls and chimneypiece of 18th-century character, which receives the light from the window. The black dress of the young mother contrasts with her rich auburn hair, while there is a creamy softness and delicacy in the lighted panelling. The technical qualities of the work and the details of chimneypiece are admirable, but it is a scheme of colour and tone. His subject, "The Morning Room" (77), shows another treatment of the same scheme of tone. The same panelled background is employed, against which are posed two ladies, one reading at a table, the other, probably a sister, standing by a fireplace. The small octagonal-shaped long window adds interest to the interior, but the figures are less contrastive. The late Hugh Carter's "Interior of a Court House" is an admirable example of that clever artist's skill as a painter of interiors and figures. It is admirable in tone. A. Ambrose McEvoy's "The Book" (65) is another skilful interior study, in which the relation and composition of the figures are excellent. One lady, in rich maroon dress, is looking at a large folio volume on an old bureau, the other lady is stooping over her. The accessories exhibit knowledge, and the tones are delicate and harmonious. James Charles, in his "Sweet Rest" (66), a sunny meadow with cows reposing on edge of stream, is charming in touch, and next we come to P. Wilson Steer's "A Turn of the Cards" (69), a girl in light green dress, who leans forward from a settee on a small table, and is shuffling a pack of cards. The drawing and expression of face are not the strongest points, but rather the delicate colour of the dress and tints of the face and light blue of the wall behind. Another clever suggestion of flickering light on leaves is James Charles's "Picking Verne" (70), after which we may mention James Henry's nice-toned and subdued "October Morning," Alfred Thornton's "Monte Bignione" (72). William Orpen, whose work is always refined and technical, has an admirable portrait subject, "Portrait of George Moore" (73), exhibiting the best qualities of the painter; it is a small study. The attitude of the sitter, pensive in face and posed sideways in the chair, his face expressive and receiving the light from the window, is unconventional. The head is resting on the hands. The light reflection and the red curtain to window are skilfully handled. His main work forms the centre picture at the end of gallery, and is "Colonel and Lady Eva Wyndham (Quin and Family)." There may be different views of the success of this large family picture; but at least it is a difficult subject to arrange and compose a family group of several figures. The point of attraction is a black Pomeranian dog. A little boy is drawing the dog's attention, while the father and mother—the latter seated—and two young daughters standing are apparently taking an interest in the dog's movements. The subject is treated with much realism, and the light is well arranged on the figures and accessories of room; the gradations of tone are successfully handled. His portrait of Augusta Everitt (90) is also an earnest presentment of features. Then we have his crayon sketches, "The Bath" (133) and "After the Bath" (137), a mother and her infant, very free and cleverly treated. "Miss Isola Russell, Snake Charmer of New York City" (81), by Sholto Johnstone Douglas, is well handled. Mrs. Ethel Walker in "The Roses" (79), a figure of a lady, in a drawing-room, stooping over a

basket of flowers on a chair, is decidedly graceful and delicate in drawing and colour, and her portrait of Miss Darroch (83) is realistic. "Evening Sunlight" (82), a study of a girl seated at a kitchen table, is charming in the reflection of light on the wall and the simplicity of composition of the quiet interior. It is by Mrs. Mary McEvoy. Miss Lily Blatherwick (Mrs. Hartick) contributes a pleasing picture, "The Orchard," a hillside of white blossom, delicate in colour. Miss Alice Fanner also has a river scene at Datchet of merit.

One of the cleverest works by a lady artist, Miss Marion Powers' (99) "Heirlooms," represents a sombrely painted interior, its darkness broken by subtle reflections, and by the glittering plates of china which fill the shelves of a large dresser. It is painted with much power and subtle skill. A girl crouched on floor, half in deep shadow, is cleaning a large plaque. Next we have one of the most captivating portraits in the gallery—that of "Mrs. M. B. Furse," by Chas W. Furse (107). This lady is shown as a half-length, graceful in pose, standing against a garden or landscape with trees. She wears a low cut-white dress with a lilac sash, and a large picture hat with roses. A richly-trimmed blue cloak loosely hangs from her shoulders. The reflected light adds charm to the face and figure of this very originally handled and graceful portrait. A. Bellingham Smith's view of "Knaresboro', Yorkshire" (102), is a bridge scene, but lacking breadth. J. R. K. Duffs has a sylvan glade, "Through the Trees," with sheep, delicate in tone, and Mark Fisher (106) a strong rendering of a meadow in sunlight, "An Irish Pastoral." Miss Alice Fanner sends an Argyllshire view, "Stormy Weather," a clever hillside under a stormy sky. We may also mention as creditable works A. E. John's portrait of "Professor John Macdonald Mackay," in red robes (113); A. S. Hartrick's "In Arcady," in which his technical power and delicate treatment are manifest in the steep upland; L. A. Harrison's "Study of Sea" (112); and a blossom-edged garden—a sunlit effect (115); Bernard Sickett's "The Castle of Ischia" (116); Moffat Lindner's "Ebb Tide, St. Ives Bay" (120); a portrait by C. H. Shannon of a lady in light grey dress, leaning forward; Alex. Jamieson's "View in the Oratory" (123); D. Murray Smith's "St. Margaret's, near Dover" (124); and Mrs. Mary McEvoy's "The Canary Bird." There are also a few interesting chalk studies by A. E. John and A. Orpen. The exhibition will repay study, not so much for conspicuous merit, as showing a few new departures in study and treatment.

THE SOCIETY OF ARCHITECTS.

THE first meeting of the session 1903-4 was held at St. James' Hall, Piccadilly, W., on Thursday, Nov. 19, at 8 p.m.

THE LATE MR. SILVANUS TREVAIL.

The President, Mr. WALTER W. THOMAS, in opening the proceedings, said the beginning of the session had been clouded by the unlooked-for death of their late President, Mr. Silvanus Trevail. The news had come as a great shock, and the circumstances under which so useful a life had been suddenly terminated was a matter for the deepest regret to the Society, with which he had been connected for eighteen years, and no less to the senior architectural body, the R.I.B.A., with which Mr. Trevail had been associated as a Fellow for ten years. A vote of condolence to the relatives was unanimously passed.

During the evening the following gentlemen were elected to membership and studentship:—

For Hon. Membership: Colonel C. O. Ellison, past president, 22, Sir Thomas-street, Liverpool.

For Membership: Franklin Joseph Bellamy, 18, High-street, Yeovil; Alexander Burnett Brown, 12, Norfolk-street, Strand, W.C.; Percy Martin Da Feu, 3, Buona Villaa, Ventnor; Saml.

Doddimeade Edmunds, 79, Victoria-street, St. Albans; William Longfield Hill, 38, Albion-street, Leeds; Herbert William Hillier, 83, Palace Chambers, Westminster; Aubrey Burton Houchin, Bloomsbury Mansion, Hart-street, W.C.; William Herbert James, 4, Bloomsbury-place, W.C.; Rowland Lloyd Jones, 14, Market-street, Carnarvon; Charles Mitchell, 132, Princes-street, Edinburgh; William John McWilliams, Library Buildings, Port Elizabeth; George Meek, 20, Leinster Chambers, Manchester; William Henden Winder, 48, Bedford-row, W.C.

For Studentship: Clive Ewart Ardley, 5, Baron's Court-road, West Kensington; William Heather Evans, 8, Portland-street, Southampton; Walter Scott Mackintosh, 63, Denzil-avenue, Southampton; Joseph Peasood, 5, Thornton-road, Stanwix, Carlisle; Oliver George Bond, 15, All Saints-place, Stamford; Herbert Longstaffe Webb, 64, Berners-street, W.; Evelyn Shirreffs, 10, Hyde Vale, Greenwich; Isaac Alexander Simpson, 104, Bewsey-road, Warrington; John Stalker, P.O. Box 1038, Johannesburg, S.A.; James Stewardson, Petterhill Bridge-terrace, Carlisle.

The balance-sheet for the year ending Oct. 31, 1903, showing a reserve fund of £700 and a surplus of over £1,100, was adopted. The PRESIDENT then delivered the

PRESIDENT'S ADDRESS FOR 1903-4.

To elect a man to the office of President is to bestow upon him the highest honour which it is in the power of the members of a society to confer, and to place upon him many responsibilities, not the least of which is the preparation of a presidential address. Let me say at once that I greatly appreciate the honour done to me, not merely from a personal point of view, but as the representative, as it were, of that large body of country practitioners which is the backbone of the Society, and to whose support it is largely due that the Society holds its present position in the architectural world. One result of the existence of so many architectural societies is that about this time of year there is somewhat of a plethora of presidential addresses covering much the same ground, so that it becomes a matter of difficulty to prevent clashing, though, on the other hand, one may perhaps learn what to avoid. The very few remarks which I shall address to you to-night will deal so far as possible with that practical side of our profession, more particularly with the various questions taken up by the Society, and indicating some of the directions in which it might extend its sphere of utility, for the welfare of the Society is surely a member's first care, seeing that the stronger it becomes the more advantages it will be able to give him. I am fortunate in coming into office at a time when the Society is in so prosperous a condition, a state of things for which we have to thank those who in the early days of difficulties and in the face of much adverse criticism and strenuous opposition stood by and supported it. The Society has arrived at a stage of its existence when its sphere of utility and influence has been demonstrated beyond question, and when it might well essay to stand alone, not only in regard to such matters of general interest as Registration, but on questions which more particularly affect the members, such as a scale of charges, a form of contract, articles of pupilage, conditions under which alone a member will compete, &c. Let me first deal with one or two matters of general interest.

ARCHITECTURAL EDUCATION.

Nothing has done more to promote the advancement of architecture in this country of late years than the gradual development of schools of architecture, and the institution of chairs of architecture in connection with the universities of Liverpool and Manchester, the former being the first of the kind in this country, and the latter owing its existence largely, I believe, to the efforts of the Manchester Society of Architects. Most of the allied societies afford facilities for gaining knowledge, the Leeds and Yorkshire Society being perhaps the most prominent with a new scheme which has every indication of being successful. And I trust before long the University of Wales, at Aberystwith, will have its school of architecture, which will have my hearty support if established. The new school of architecture in London in connection with the Architectural Association has just completed a most successful first year's work, and is deserving of the hearty support of the profession; its curriculum is unique and its scheme admirable, providing as it

does a means whereby a man may test his adaptability for the profession before binding himself down for a term of years, thus enabling him to withdraw in good time if he finds that his abilities are such as would have better scope in some other profession. The great fault of the usual system of pupilage, to my mind, is that in many cases a youth is bound down for a term of years, only to find at the end that he has mistaken his vocation and wasted time and money. In Ireland also this question is receiving consideration; but, after all, these praiseworthy efforts to raise the standard of architectural education do not much more than touch the fringe of the profession, for the reason that the system is a voluntary one, and until schools of architecture are State supported, or, in other words, a system of statutory education is established, it is hopeless to expect that more than a small proportion of students will avail themselves of the advantages now open to them. A system of compulsory education would do good in two ways—it would show to the intending student exactly the course of study which he must necessarily take if he ever aspires to be more than a subordinate, and so would enable him to shape his studies from the first with a definite object in view, while the mere fact of a certain standard being set up, which all must reach, would tend to stop the ever-increasing stream of incapables who are now attracted to the profession by the fact of its being open to all. This question naturally brings one to a matter, in which the Society is particularly interested—viz.,

STATUTORY REGISTRATION.

Does it not seem to be not only common sense, but common justice, that a man who has entered the profession by legitimate means, that is, by spending his time and money in properly fitting himself for its duties and responsibilities, should be protected against the bogus practitioner whose only claim to the title of architect is the fact that it appears on his door-plate? The principle of registration is one against which a valid objection has never been made; it is only when it becomes a question of carrying into effect that principle that objections are raised on certain points by those who are so bigoted and prejudiced as to be unable to consider the matter from any point of view other than their own narrow one, and who endeavour to obtain a cheap popularity by the easy way of indiscriminate condemnation of a measure of the clauses of which it is evident they know nothing at all. Very little to my mind is gained by controversy, but much may be accomplished by persistent and continued effort towards a definite end. No amount of argument can get over the fact that the profession is practically solid on the principle of registration, and when it comes to fighting out the details the common sense of the majority must win. It is not my wish or intention on this occasion to go deeply into the pros and cons of the question, but I should just like to take one point. If I understand our opponents rightly, their main objection to the Bill is based on the assumption that it will be the means of indiscriminately registering all and sundry without question, and that thereby the evil which they admit now exists will be increased. This only shows what irresponsible statements can be made and what inflated nonsense is talked in the hope of stemming the tide. It is true that Parliament will not pass any measure which does not protect properly vested interests, and quite rightly, but that is a very different thing from registering indiscriminately. The Bill provides for registering only those who can prove to the satisfaction of the General Council that they were before a certain date and are still actually practising architecture, the General Council being composed of a body of architects in the nomination of whom the R.I.B.A. has the preponderating influence, and the choice of who shall be registered rests entirely with the General Council, which might be supposed capable of properly adjudicating on the claims placed before it. The president of one of the allied societies recently said in effect that an imperfect Bill was better than no Bill; this is perfectly true, because the least that a Bill would do would be to stop admission to the profession except by legitimate means, and for that reason alone it would deserve every support. The position of an objector who is already a member of any architectural body is an untenable one, because he has already admitted his agreement with the principle by voluntarily registering himself, and that objector forgets that though he may to a certain extent protect himself by so doing, yet so far as the public are

concerned he cannot prevent these persons he may consider unqualified from inserting their names alongside of his in the public directories and other lists, so that he is to all intents and purposes compelled to submit to be classed in the public eye with all and sundry who may care to assume the title of architect, so that he at present suffers the indignities which he pretends to fear would be the result of a Registration Bill. Every man has a right to his own opinion, and if there are a few who are genuinely satisfied with the present state of affairs, or who are unable to express an opinion one way or the other, there are very many others who are not content, and who will agitate until they get what they want. It is understood that the architectural societies generally are in favour of registration, and that some of them have urged the R.I.B.A. to take the matter up. That is as it should be; the senior body is the right one to take the lead in this. But because it does not do so, that is no reason why others should not, and the support that the Society has lately received shows that it is recognised that it is not fighting for its own hand, but in response to a generally expressed feeling in the profession that the time has come when the matter should be taken up in earnest. The tendency of the times is towards federation, and in matters architectural there is the same feeling and desire for consolidation, and for some strong central authority to control the whole. Straws show which way the wind blows, and recent events in Ireland and elsewhere make it plain that the senior body is acting against its own interests in not fairly and squarely facing the question of registration. It is encouraging to find the President of the R.I.B.A. making registration the principal theme of his address, and to have his assurance that the Royal Institute is in sympathy with every effort to raise the status of architecture and architects in this country, which, of course, includes the registration movement; but it is evident that the only practical way of obtaining the desired end—viz., by Parliamentary powers—will not be sought by the Institute until it has tried every other possible scheme. The proposal to form a Board of Architectural Education, if carried out, may be useful in focussing and controlling the efforts of the various schools of architecture throughout the country, but it will do nothing at all to remedy the grievances which, it is admitted, exist in the practice of architecture. As usual, the Institute fears to definitely pledge itself one way or the other on the question, though it admits that the large body of opinion in favour of compulsory registration cannot and must not be ignored. The Institute is apparently on the horns of a dilemma; anxious to propitiate those few leaders who object, and at the same time knowing that the general body of practitioners must be reckoned with, it proposes a middle course: that of a scheme of voluntary education, which, however good and desirable in itself, will be unable from its very nature to deal effectually with the question. Such a scheme will not at all appeal to practical men who are aware that nothing less than statutory powers will enable any authority to deal effectively with such an important question as the education and consequent necessary registration of architects. The present situation may be summed up in a few words: It is admitted that grievances exist which should be remedied; the question is, how? Very many of us know and say that there is but one practical way, while a few others are anxious to try various schemes before accepting the inevitable; but let those who think they can by any means effectually hinder progress in this matter remember the legend of the Saxon King who was taken down to the seashore and told what a clever fellow he was. He showed his advisers, however, that he could not stop the advancing waves, and if our opponents care to see a parable in that, the advancing water is the tide of progress, which they can no more stop than could the wise old king the waves.

PUBLIC IMPROVEMENTS AND BUILDING RESTRICTIONS.

There must necessarily be certain restrictions and conditions imposed upon those who propose to erect buildings; but one would naturally think that when these conditions emanate from the landowner, who is presumably anxious to dispose of his sites, that they would be of such a character as to encourage rather than put off an intending buyer. The opposite seems to have been the case in the Holborn-to-Strand improvements. Those who have read the conditions of sale will see at

once that they are of a character calculated to make the boldest hesitate; the decision on any point afterwards arising is in the hands of the Council's architect, from which there is no appeal. The objection is not a personal one to the architect as such, but to the principle which places so much power in the hands of an official. There must be something wrong when the opportunity to secure sites in so valuable a centre fails to attract purchasers. I think the conditions should at any rate be subject to an appeal and arbitration in case of dispute. This is a question not only for lessees, but for architects, who have to advise their clients who propose to take sites. If there is no reference to an arbitrator in case of a dispute, a client may be mulcted in a large additional expenditure he never contemplated, and which may bring him to ruin.

CONDITIONS OF CONTRACT.

It is satisfactory to find that after negotiations extending over eight years a form of conditions of contract has been arrived at between the R.I.B.A. and the Institute of Builders, which contract defines as definitely as may be the relative positions and responsibilities of the building owner, the architect, and the contractor.

ARCHITECTURAL COMPETITIONS.

It is a sign of the time that a few architects should have been obliged to form themselves into a Competition Reform Society with the object of "blacklisting" competitions with the conditions of which they do not agree; and they have done good work in this way. But why was it left to them to take it up? Here again is shown the want of the strong hand. The present system of putting out designs to competition is one which has come to stay; and it is not to the credit of the profession as a whole that in spite of protests and requests that architects should not compete in certain instances, there are always found some who will disregard such requests; and it must lower those who enter in the eyes of the promoters themselves to find that there are men willing to quote terms on which they will undertake the work in the event of their being successful. Such practices want putting down with a strong hand. But who is to do it? Were there a statutory authority, it could absolutely control these matters by making it a question of professional conduct. Promoters would then quickly see that it was waste of time to come before the profession with any invitation to compete, the conditions of which were not in accordance with professional usage.

ASSESSOR AS JOINT ARCHITECT.

There is a matter in connection with the Liverpool Cathedral Competition which, I think, has not received the attention it deserves, and that is the appointment of the assessor to act as joint architect with the author of the selected design. I maintain that the principle is an entirely wrong one and opposed to the best interests of the profession, and I consider the attention of the profession should be called to it, and that steps should be taken, say, by the Competition Reform Society to bring the matter to the notice of those in authority. Also the competition for the Liverpool Pierhead Baths and Tramway Offices, which in the first instance proved a failure. Yet there were found six or seven firms of architects to enter into a second competition for baths only, without any assessor being appointed or any premium offered. Then there was the competition for the housing of the poor upon the site known as the Hornsby-street area, Scotland-road—another failure—the work being afterwards carried out by the corporation's own officials. Surely this state of things can only have one result, and that is to drag the profession through the mire. If the profession does not respect itself, what can it expect from the public and public bodies? You cannot find any other profession that would submit to this sort of treatment in the way the architectural profession does. I am glad to say that the firms of architects who act in this way are getting fewer every year, and the sooner they are wiped out the better for the profession. Having expressed my disapproval of certain things, I must give credit when credit is due. The Liverpool City Council and the citizens have done more than any other city in England to advance architecture and public improvements.

LIVERPOOL CATHEDRAL.

One of the most important works of modern times will be the cathedral it is proposed to erect in Liverpool, the proposed dimensions of which are quite equal to any of the ancient cathedral buildings of England. In fact, the two towers

will probably be higher than any church or cathedral tower in the British Isles. His Majesty the King has recognised the importance of the work by intimating his willingness to lay the foundation stone in the spring. The area of land covered by the buildings without cloisters will be about 10,200 square yards, a greater area than which only one or two, if any, cathedrals in England occupy. The committee has done exceedingly well in accepting the decision of the referees in the competition recently held. It had a precedent for appointing so young an architect as Mr. Gilbert Scott, for Mr. H. L. Elmes was about the same age when he won the competition for St. George's Hall, Liverpool. This leads me to say that I hope that a memorial to Elmes will, before long, be erected in St. George's Hall. But the cathedral is not the only great building that Liverpool is about to erect. The Liverpool Dock Board has recently had a competition, and a very satisfactory conclusion was come to when they accepted the designs of a local firm of architects. The Liverpool Corporation has completed and opened a new Technical School, built from the designs of a London architect. The Royal Insurance Company has recently erected a magnificent pile of buildings of the most modern construction. Then there is the New Church House in Lord-street. The banks and the large steamship companies and tradesmen appear to find their own offices and shops too small, hence old buildings are being pulled down and palatial new erections are taking their place, amongst them being new offices for Sir Alfred Jones. The city to which I belong has always been in the forefront—I might almost say has led public opinion with regard to all questions for improving the conditions under which the labouring classes have to live. The housing question has been taken up in an enthusiastic spirit, and made a special study of by the housing committee and the council. Although many admirable schemes have been brought to a satisfactory completion in the past, it is only a few days ago that a further scheme was inaugurated by H.R.H. Princess Louise to erect labourers' dwellings at a cost of £150,000. The Liverpool School Board, which has now ceased to exist, have made a particular study through their various architects of the highest standing in Liverpool, of school building, and the most recent one erected, Birchfield-road School, is, I suppose, as complete an elementary school building as will ever be erected.

ARCHITECTS AND THE EDUCATION ACT.

Whilst speaking of elementary education I would particularly like to draw the attention of architects to their position under the new Education Act. Most of the committees are formed of sub-committees of city councillors or county councillors or urban district councils. Now, most of these gentlemen seem to think the persons they ought to employ as architects and surveyors for their future new buildings are their city surveyors, land surveyors, county surveyors, road surveyors, and other gentlemen whose particular qualifications are more of the nature of land stewards, bridge masters, and road surveyors than architects. Now, there are gentlemen in our profession who, during the last thirty years, have made a particular study of school building, and it appears to me that the valuable experience that they have gained during that period will be lost to the community if the principle I have just indicated is persisted in. Most of the county and city surveyors have as much work as they can possibly personally attend to, and they have had in the past no practical or personal experience of school building. Therefore it is very important that we, as the Society of Architects, should bring before the notice of these various authorities the importance of appointing architects of experience in school construction to look after the supervision of their schools in the future, and not leave them in inexperienced hands, with results that will mean disaster and increased rates.

ANCIENT LIGHTS.

A question in which the Society of Architects is particularly interested is that of "Ancient Lights," which is to form a subject of discussion at our next meeting. The Bill which has been drafted by the Joint Committee of the R.I.B.A. and the Surveyors' Institution does not seem to do much more than take the matter out of the hands of the lawyer to put it into those of the surveyors, so that the benefits of the building owner are not increased—rather the opposite in some cases.

THE FUTURE OF THE SOCIETY.

Turning now to matters which more particularly affect the immediate needs of the Society and its members, I need only refer you to the report presented at the last meeting and the balance sheet which has been put before you for evidence that the Society is in a thoroughly sound position and entitled to look forward with some confidence to considerably extending its scope within the immediate future. It is within the province of every member to assist the Society in developing its resources to the utmost extent; its growth and influence depend on individual effort, and no opportunity should be lost of making the Society fully representative, particularly of that important section of the profession to which it especially appeals—viz., the provincial practitioner, who has more difficulties to contend with in his endeavours to honourably carry out his professional duties than perhaps the Metropolitan architect has any conception of. Particularly is this the case with the architect in the smaller towns, where perhaps the scope is not great, and where he has to meet encroachments on his legitimate sphere of practice. Membership in any corporate body not only confers certain privileges on those who gain admittance, but it also entails upon them certain obligations, one of the greatest of which is that of forwarding in every possible way the aims and objects for which that body was founded. Especially is this the case with a young and growing Society such as ours, which actively takes up questions it believes to be for the general good, in a way which no other architectural society has attempted. It speaks well for the Society that, in spite of, or perhaps because of, the institution of a stiff entrance examination and other tests as qualifications for membership, our numbers go on steadily increasing; but there is yet great scope in this direction, and it should be the duty and pleasure of every member to recommend for membership those whom he knows to be fully qualified, and so to enlarge the influence of the Society, and by this means show his practical interest in its welfare.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE second ordinary meeting of this Institute was held on Monday evening at 9, Conduit-street, W., Mr. John Slater, Vice-president, in the chair, when a distinguished company assembled to hear a paper by M. Jean Théophile Homolle, hon. corresponding member, and director of the French School at Athens, who had come specially over from that capital to read it, the subject being

THE TREASURY OF CNIDUS AND THE IONIAN ART OF DELPHI.

On the walls were hung plans, and an ideal restoration in perspective, to an unusually large scale, of Delphi, executed by M. Albert Tournaire, and lent for the occasion by the French Government, and also a series of charmingly-rendered water-colour drawings of the recently-discovered sculptures in the frieze and pediment of the Treasury, the work of Signor G. S. da Fonseca. The address, which was delivered in fluent French, with but occasional reference to notes, was illustrated by some six-and-twenty lantern slides.

Having paid a glowing tribute to the memory of the late Mr. F. C. Penrose, and to the accuracy of his conclusions as to the optical refinements of the Greek temples, the lecturer proceeded to describe his recent discoveries at Delphi, and especially at the little building known as the Treasury of Cnidus, which he accepted as a typical work of Ionian architecture of the sixth century B.C. He was glad to have been associated in the work with English architects and archaeologists. He showed the position on a plateau below the theatre at Delphi of the famous Temple of Apollo, by the aid of photographs of the actual site and M. Tournaire's conjectural restoration of the building in its prime. At the first bend of the sacred way at the foot of the hill leading to this temple was built the Treasury of Cnidus. It was in absolute ruins; but it was possible to mentally restore, from the fragments which had been recovered and collected, together with other examples from elsewhere, but similar in character, some idea of its appearance. Having compared the actual ruins of foundations and fragments with an ideal restoration, M. Homolle proceeded to analyse the architectural details. The Treasury

was a small isolated building in *antis*, Ionic in style, about 25ft. by 20ft., surrounded by a continuous frieze. In front was a pair of gigantic female figures acting as caryatides, and supporting an entablature, frieze, and pediment, the two latter being richly ornamented with painted sculpture. In front of the building was a crouching sphinx, and a lofty pair of columns on either side, above an Ionic capital, supported each a winged flying female figure. M. Homolle said he proposed in the first place to justify the restoration thus shown by an analysis of the architectonic elements of the building and its accessories; secondly, to study the decoration of the monument in its architectural ornaments, properly so-called, in the sculptures in high or low relief, and also in the paintings, with which the effect of these were heightened; lastly, he intended to make a plan of the Treasury of Cnidus, and the importance of the Ionian art displayed at Delphi in its general relationship to ancient art, showing illustrations of the plan of the temples, and of many of the fragments. The author explained the basis for a restoration of the entablatures of the front portico, the side façades, and the rear. The beautiful sculptured frieze was, he pointed out, inclosed with a continuous ornament of ovolos in the cornice; the space above was decorated with palm foliage and lotus buds; the pediment, and the triglyphs both below the pediment and the side faces, and the acroteria were admirably carved, as were the sphinx and flying victories. M. Homolle also explained his grounds for the restoration of the approach steps, from the lower courses still remaining, on the analogy of those existing at the Treasury of Phocæa. The restoration of the caryatides and their bases were calculated from the known height of the monument; but in 1894 the trunk of one of the figures was found, and four years later its head was discovered, the two portions exactly fitting together, and agreeing with the previous estimate. Restorations were also shown of the Ionic capitals above the caryatides and of the doorway, from the models now in the museum at Delphi. One was impressed, when examining these remains of the Treasury, with the richness, even to surfeit, of the decoration, both in sculpture and as heightened by the polychromatic decoration afterwards applied to the carving. The architectural decorations were described in detail. The mouldings were decorated with beads and ovolos; the plain surfaces were ornamented with flowers, with palm-leaves, and lotus-buds, these being employed on the dripstones and eaves, the jambs and cornice of the gateway. There was a uniformity of *motif*, varied by appropriate adaptation to the several members of the architecture. An admirable excellence was displayed in the execution; a vigorous fullness, a trifle heavy in treatment, but powerful in effect. These gave a special character to the Treasury of Cnidus. The subjects of the bas-reliefs of the frieze were continued on all the four façades of the building. That on the west front illustrated the Apotheosis of Hercules; that on the south, the Carrying off of the Daughters of Leucippos; that on the east the contest of the Greeks and Trojans over the body of Euphorbos, under the eyes of the gods assembled in Olympus, and that on the north face, the Battle of the Giants. The bas-reliefs might be divided by their style and technique into two groups, each consisting of two friezes: one pair was in contour angular, the other smooth; one pair was modelled in the round, the other was flat in treatment. The proportions and the forms were those of archaic Ionian art of the 6th century; the figures were short and heavy, the technique was dry. The composition throughout was governed by the rigorous laws of symmetry. The principal figures were equally grouped around the principal motifs, in analogous and inverted attitudes as one receded from the centre. Occasionally a certain awkwardness in their compliance with the laws of unity was manifest, as in the contest of the Greeks and the Trojans under the eyes of the assembled gods. The drawing and composition recalled the painting of vases with black or red figures, in the severe style of the end of the sixth century. The sculpture on the pediment represented the wrestling between Apollo and Hercules for the possession of the tripod of Delphi. The style of execution in this pediment was, the author demonstrated, the same as that of the friezes; in treatment it most nearly approached the manner of the west and south friezes, but was somewhat more hard and coarse. This work has a mixture of high and low relief, the figures being partly

free and partly attached to the background. Passing on to consider the large sculptured accessories, M. Homolle pointed out that the sphinx and winged victories were of the type of those at Delos and the Acropolis at Athens. The caryatides figure which had been seen showed some resemblances to, but differences from, the archaic figures at Athens; but it had some traces of Egyptian influence. The polychromatic decoration had been copied with great precision by M. Fonseca in his remarkable water-colour drawings. Colour had been applied to architectural ornaments, to the frieze and pediment, and also the figures in low relief. A common principle had inspired all the work, which consequently has a general harmony and a monumental character, decorative and non-realistic in effect. Three colours were employed in this ornamentation—white, the colour of the marble, slightly modified by glazing; blue, applied to the backgrounds; and red for garments and other prominent features. Having demonstrated the resemblance between the sculpture of the Treasury and contemporary vase paintings, M. Homolle mentioned that the name of the monument—the Treasury of Cnidus—was given us by the inscriptions graven upon the building itself and by an incidental allusion by Pausanias. The style of the sculpture and of the architecture assigned it definitely to the 6th century, and the Asiatic Greek that of Ionia; we were driven to the like conclusions by a study of the history of Cnidus. It was then a work of the Ionian province—Ionian in workmanship and in spirit. It was rich to exuberance; vigorous, but a little heavy; but showed originality of invention, strength of handling, and marvellous ability in execution. In closing, the lecturer traced the persistence of these qualities in Ephesus, Branchides, Xanthos, Priene, and Pergamos; and showed slides of the well-known sarcophagi of Clazomenus and of Alexander.

Dr. ALEXANDER S. MURRAY, keeper of the Greek and Roman antiquities in the British Museum, in proposing a vote of thanks to M. Homolle for his splendid and eloquent address, referred to the Treasury of Cnidus as one of the most charming Greek buildings that he had ever seen. M. Homolle had proved by his convincing arguments and by the photographs and drawings, that the art was essentially Ionian. They were under a great obligation to him for coming all the way from Athens and for so clearly explaining his discoveries, but also as the instigator and superintendent of the extensive—he might say unequalled—excavations carried out at the cost of the French Government in Delphi. He trusted that M. Homolle would be able to complete his gigantic task.

Mr. GEORGE H. MACMILLAN, secretary of the Hellenic Society, seconded the motion, and remarked that M. Homolle had revealed to them, step by step, the mode in which he revealed the treasures so long hidden at Delphi. He hoped that next year, when the Hellenic Society completed its twenty-first year, M. Homolle would return to London and further explain the discoveries he had made.

Dr. ARTHUR W. EVANS, in supporting the motion, remarked that at Delphi they had the beginning of Greek religion, and it was interesting to note the marble face of a lion shown that evening closely resembling one of the objects disinterred at Knossos. He had seen the village which occupied the site before the excavations at Delphi were begun, and could appreciate the vast labour that had been carried out by M. Homolle, and the public spirit and generosity of the French Government, and trusted that the British Government would follow their example. The wonderful reconstruction of the Treasury from mere fragments displayed the genius of the explorer.

Mr. MYERS and Sir L. ALMA-TADEMA, R.A., also took part in the discussion.

The CHAIRMAN, speaking in French, explained the purport of the remarks to M. Homolle, and expressed the appreciation all present felt of the high services he had rendered to the archaeology of Asiatic Greece, and likewise the gratitude felt by the Institute Council for so generously lending the splendid array of drawings on the walls.

M. HOMOLLE briefly responded.

A verdict by consent for £7,550 has been given in the Sheriff's Court, London, to Mr. W. E. Brown and Mrs. Rowe, the freeholders of 2½ acres of land which are required for the extension of Brixton Prison.

THE QUANTITY SURVEYORS' ASSOCIATION.

A GENERAL meeting of this recently-formed Association was held on Wednesday afternoon at the Duke's Saloon, Holborn Restaurant, for the purpose of approving the memorandum and articles of association, and of electing office bearers. Mr. W. Hoffman Wood, F.S.I., of Leeds, was called to the chair. The attendance numbered about fifty well-known members of the profession, and the various proposals were keenly debated. Mr. F. B. Hollis, hon. sec. and treasurer pro tem., read the minutes of the preliminary meetings which led up to the organisation of the association, and also a lengthy correspondence which had passed between himself and Mr. Julian C. Rogers, the secretary of the Surveyors' Institution. Mr. Hollis had written explaining the proposals, and asking if the Council of the Institute would grant the use of one of the rooms in Great George-street, on loan or hire, for their early meetings, as the promoters desired to work in harmony with so influential and old established a body. In reply, Mr. Rogers stated that the request had been referred to a committee, who had come to the conclusion that there were many objections to multiplying associations for members of the same profession by creating a separate organisation for each separate branch, and especially to the setting up of competing systems of examination. Mr. Hollis read many letters of apology and regret for non-attendance, including those from Messrs. Henry Adams, A. T. Babbs, of Cape Town; J. A. Bonds, W. Prowse Broad, and W. M. Law, of Liverpool.

The Chairman expressed his gratification that out of very small beginnings, a letter he had written to the professional Press at the beginning of the year, so large and influential movement had arisen. Already some 150 members of the profession had promised to join, of whom about one hundred were practising in London and the other fifty in the provinces. Mr. Hollis had rendered the promoters valuable services in the early days, not only as hon. secretary, but by freely lending his office for meetings. They had met with a little opposition from unexpected quarters. A leading surveyor, Mr. John Leaning, whose books on the subject of quantities had been of such service, had written strongly objecting to any attempt on the part of quantity surveyors to form themselves into a society; but his criticism had been a blessing in disguise by attracting public attention to and advertising the proposal. It was difficult to understand the attitude of the Surveyors' Institution to the movement, nor why quantity surveyors should not avail themselves, as municipal, district, mining, and Ordnance surveyors, and other branches of the profession had done, to unite together and do all in their power to raise their status, and obtain improved regulations and better training for younger members. It was evident that many benefits would accrue to the junior practitioners from such an association. In nearly all builders' agreements architects' clauses were inserted, which in many cases provided that in case of dispute between architect and builder, a second architect should be called to decide. This might in some cases be very prejudicial to the original architect, and a more satisfactory arrangement would be to appoint the surveyor as arbitrator. The association would also endeavour to provide for fair competition for public works, and for uniformity of practice and charges. It must be left an open question whether, if an architect possessed the ability, skill, experience, and, he might add, leisure, he might not, if so disposed, take out his own quantities, and he for one would not discourage such a practice, and in the smaller towns this was a necessary element of the architect's business; but the habit of touting for quantities indulged in by some architects could only be deprecated. As time went on, it was to be hoped that the master builders in the larger towns would band themselves together and refuse to tender for any works but those for which bills of quantities had been prepared by a recognised member of that association.

A discussion ensued as to what should be the title, limitations, and object of the association. It was unanimously agreed, on the motion of Mr. Thomas J. Carless, seconded by Mr. R. L. Curtis, senior, and supported by Mr. Walter Lawrance, that the title should be "The Quantity Surveyors' Association."

The warmest controversy of the evening arose on the point whether membership should be

rigidly restricted to those practising "solely" as quantity surveyors, or extend to those who were fully qualified to take out quantities, but also carried on professional business as architects. The question was raised by Mr. R. L. Curtis, who said if the stricter interpretation were enforced he would be necessarily excluded. Mr. A. R. C. Buss, Mr. Taylor, Mr. C. W. Bowles, and several other London practitioners urged the desirability of excluding all who also acted as architects. This was opposed by Mr. A. G. Cross, Mr. A. J. Gate, Mr. T. J. Carless, Mr. R. L. Curtis, jun., Mr. G. A. Oviatt, Mr. H. J. West, Mr. W. R. Hood (who asked for a definition of a "fully qualified quantity surveyor"), Mr. Reginald J. Tollit, of Cambridge, Mr. H. L. Beckwith, of Liverpool, Mr. Lansdown, Mr. W. Lawrance, and others. Eventually Mr. Carless moved, and Mr. Hollis seconded, that "qualified quantity surveyors" be eligible for membership. An amendment stipulating that they be "solely" eligible was lost by a large majority, and the motion was then unanimously adopted.

Mr. J. Johnstone, hon. solicitor, read the memoranda of articles of association, and in answer to questions explained the various technical points relating to registration. Mr. A. J. Gate moved, and Mr. Joseph Aylott seconded, that the memoranda be confirmed and adopted. This was carried unanimously, as was, after some discussion, a resolution, proposed and seconded by Mr. A. G. Cross and Mr. H. England respectively, that the drafting of articles of association and the formulation of by-laws be left to the council hereafter to be elected. It was further agreed, on the motion of Messrs. Gate and Lawrance, that these should be subject to confirmation by the general body of members at a meeting to be specially convened.

The question of the constitution of the governing body was discussed at some length, the original proposition to appoint in all eighteen members—viz., a president, three vice-presidents, a council of twelve, with a secretary and treasurer to sit on the council *ex officio*, being rejected on fuller consideration as too unwieldy, and therefore without due sense of individual responsibility. It was therefore resolved, on the motion of Messrs. Gate and Cross, that the executive body should consist of only twelve members, from among whom the members should select the president, two vice-presidents, and a secretary and treasurer, leaving eight ordinary members of council. It was further agreed that of the twelve members of the executive eight should be chosen from gentlemen practising in the Metropolis and four in the provinces, thus securing representatives in exact proportion to the relative strength of membership. Thirteen members were nominated to represent London and five to represent provincial surveyors, and on a vote being taken the voting resulted in the election (as named in alphabetical order) of Messrs. H. L. Beckwith (of Liverpool), Curtis Card (of Lewes), H. Crickmay, A. G. Cross, R. L. Curtis, jun., H. England, F. B. Hollis, W. R. Hood, Walter Lawrance, R. J. Tollit (of Cambridge), and W. Hoffman Wood (of Leeds).

From among these names the officers and committee were elected as follows by open voting: President, Mr. Walter Lawrance; vice-presidents, Messrs. A. J. Gate and W. Hoffman Wood; ordinary members of committee, Messrs. Beckwith, Card, Crickmay, Cross, Curtis, England, Hood, and Tollit; hon. secretary and treasurer, Mr. F. B. Hollis. Messrs. H. J. West and John Nixon were appointed hon. auditors.

A vote of thanks to Mr. Hoffman Wood for his able and impartial conduct in the chair was, on the motion of the newly-elected president, heartily accorded, and terminated the proceedings.

PLUMBERS' EDUCATION AND REGISTRATION.

A CONFERENCE between the Plumbers' Company, the representatives of the larger water authorities of the country, and the Royal Institute of British Architects was held on Tuesday at the Guildhall to discuss the question of the technical education and registration of plumbers and the efficiency of plumbing work generally in connection with the public supply of water. Dr. Robert Crawford (Warden of the Plumbers' Company) occupied the chair, supported by Mr. Richard Hind, of Stockton-on-Tees (Renter Warden) and Mr. Coles (the Clerk), and there were also present delegates from the water authorities of Birmingham, Glasgow, Sheffield,

Hull, Bradford, Cardiff, Dublin, Plymouth, and other towns. The Royal Institute of British Architects was represented by Mr. H. D. Searles-Wood, Mr. Thomas Blashill, and Mr. W. D. Caröe, and the British Association of Waterworks Engineers by its secretary (Mr. Percy Griffith).

The Chairman remarked that the Plumbers' Company had done a great deal towards stimulating public interest in the matter of good plumbing, more particularly from the health point of view. Undoubtedly the country had been thoroughly aroused to the advantage to be derived from an increase of responsibility and skill on the part of the plumber. On its sanitary side, much that was of value had been done in the training of plumbers, and the attitude of local authorities towards plumbing had greatly changed as compared with what it was a few years ago. Of late, however, another department of the plumber's work had come into prominence—that relating to the prevention of the waste of water in domestic use. The Plumbers' Company did not suggest that the water authorities did not know how to manage their own affairs, but it was thought possible that the Company might act as a sort of line of union for the discussion of the means to be adopted in order to secure greater uniformity in respect of by-laws, fittings, and the skill and qualifications of plumbers. He moved a resolution approving the efforts of the Plumbers' Company to secure the more efficient training of plumbers and the registration of qualified men, and pledging the conference to support the Company's endeavours to obtain the necessary legislation in furtherance of that object.

Mr. Hind, in seconding the resolution, pointed out that the effect of the Company's efforts was visible in the improvement which had taken place in plumbers' work during the last 25 years. He hoped that architects and others would support the Company by employing registered and qualified plumbers in preference to others.

The Chairman mentioned that the Bill promoted by the Company for the registration of plumbers had been viewed favourably by the Local Government Board, but the Government had not seen their way to afford the necessary time to secure its passage through Parliament.

The resolution was carried.

Mr. H. D. Searles-Wood said that as architects they strongly sympathised with the movement for the better education of plumbers. He did not think, however, that they could pledge themselves to the sole employment of registered plumbers, because architects did not interfere between the contractor and his men. He proposed:—"That, with the object of giving practical effect to the previous resolution the representatives of the Royal Institute of British Architects and the water authorities present recommend that preference be given to the employment of registered plumbers to carry out and inspect plumbers' work executed under architects and water authorities." It was one thing, he remarked, to execute specimen joints and other things under the direction of a master in a highly fitted-up shop at a technical school and another matter to do it under the ordinary conditions in which the work had to be done in a building.

Mr. Holdsworth, Bradford, seconded the resolution.

Mr. E. A. Lees, Birmingham, said that in Birmingham there was a good many firms of the highest repute who had not allied themselves with the registration movement, and the Water Board could not shut their eyes to the fact that those firms carried out their work in a way to which no exception could be taken.

Mr. Atkinson, Hull, said the same difficulty would arise in his town. If registration was to be adopted, it should be optional for a period, and only compulsory after the lapse of several years.

Mr. Holdsworth observed that registration gave a status to a plumber, and was an inducement to men to register themselves.

Mr. Hind said that they could not at present hope to make registration compulsory, but they could make it desirable and to the advantage of plumbers to register themselves.

After further discussion, the resolution was carried.

The questions of uniformity of regulations and the standardisation of fittings was afterwards discussed, among the speakers being Mr. Blashill, Mr. Gale (Glasgow), Mr. Askwith (Newcastle-on-Tyne), Mr. O'Dowd (Dublin), and others, and it was decided, on the motion of Mr. Searles-Wood, to appoint a small committee representing

the Plumbers' Company, the Royal Institute of British Architects, the water authorities, and the water company engineers to consider the questions.

"BUILDING NEWS" DESIGNING CLUB.

A SECONDARY SCHOOL.

WE are sorry that, out of all the very large number of designs received in this the first competition for our Designing Club Session for 1903-4, there is not one plan which can be called satisfactory. The subject is possibly too special in its character to expect young architects to deal with it in a really efficient way to meet the requirements of a good, workable school and the rules of the Education Department, which necessarily govern the up-to-date details of secondary school arrangement. We have had some difficulty in arriving at an award, on account of the incomplete character of the designs in this respect, and the merits of the three best plans which we illustrate run each other very close, though the decision has been made on the principle of selection based upon that which is least deficient rather than that which is most perfect. Practically, of course, it comes to the same thing, though it is always better to make a choice because of the workmanlike efficiency and architectural merit of a design whenever it is possible to adopt this course. We fully recognise the difficulties which the students who took part in this contest must have experienced, and while we are bound to point out where they fail, we ungrudgingly commend one and all for the serious and careful way in which they have done their best.

These were the instructions:—

A.—A Secondary School for 150 boys, on an open site, with a frontage towards the south-east, facing the high street of a country town, in a freestone district. The playground will be at the rear, and the land falls 1 in 12 from S.E. to N.W., commencing at a distance of 20ft. from the street footway, where the site is level. The building is set back 15ft. from the street. The accommodation is to comprise an assembly-hall 50ft. by 25ft., and five classrooms, about 22ft. by 20ft. each. A chemical laboratory for twenty students, a preparation-room, and a balance-room; a physical laboratory, available as a lecture-room, about same area as the chemical laboratory; an art classroom for twenty students, and a small life classroom—both these to face north. A head-master's room, and a common room for the other teachers. Cloakroom for pupils, and latrines, lavatory, &c. Covered playground under part of the building, which is to be on two floors, above the ground level. Materials stone, and stone slate roofs. Style simple and picturesque. Scale for the drawings 8ft. to the inch. A plan of each floor, two elevations, and section, with a sketch view, which may be small. Drawings to be sent in so as to arrive at the office not later than October 31 next.

We place "Viking" first, "Ilex" second, and "Novocastria" third. "Viking" arranges his elevations and plans well on the sheet, and he draws clearly, though his method of blacking in the upper parts of his windows is somewhat misleading. If darkened all over, their ungainly proportions would be more easily detected. The widespread of his main roof gives breadth, though structurally there is only one place, between the central gables and the dormers, where a through truss can be inserted, while the head-room in the balance and preparation-rooms is very curtailed (see dotted line in section). The effect of the central gables is good; but the turret ought to show in the perspective, and might have been larger and higher as a matter of composition in design. There is no necessity in a secondary school for all the classrooms to open out of the central hall, and the disturbance caused by changing classes is lessened when a corridor, if only an open-sided one, is contrived along one flank of the assembly-hall. The faults of this plan of "Viking's" are the inadequate cloakrooms and lavatories, the absence of cloakroom and closets for the masters, the placing of their rooms upstairs, and inadequate provision for supervision in consequence. The entrances are exactly the same, and both have to be used by the pupils, whereas one should be more decidedly the boys' entrance and one more distinctly intended for masters' and visitors' use. The preparation and balance rooms should be made available for both laboratories. The covered playground shelter is rather good, and the balance in favour

of this plan was decided by the fact that the author gives two staircases, which are absolutely essential. It is not clear how the skylights over the first floor corridor are managed, and the section omits to show them. It also is uncertain how the roof comes with its central gutter extending so far back 'twixt the gables, the ridge line seemingly being set back in the centre in an amateurish fashion.

"Ilex" has a good first-floor plan, but he also locates his master's room up the stairway, and he gives no second staircase. The art classes being put on two floors is no advantage. The windows to the covered playground are absurd, and would always be broken. Externally they look as if they lighted rooms. The best feature in the elevations is the pretty arrangement of the central part of the front: but the cornices and moulded architraves in masonry are too expensive in style. The perspective is excessively poor. "Novocastria" gives no view. His windows are of ungainly proportions, and four stone gables cost money, though the detail is simple, and this row of gables is effective. The inconsequential projections for porches are too out up and trivial. The faults of both the first and second plans are repeated in this one, save that the teachers have one room on the ground floor. The arrangement throughout is more broken up, and the central hall is too much of a passage, with the stair arches at the ends, leaving no room for a good platform, a fault which "Viking" has committed in even a worse form, owing to the position of his classrooms. "Tudor" ranks fourth with a design marked by a prettily-conceived façade, though the turret is pimping. The open-timbered roofs over the hall and laboratories are not required, and that over the hall is ugly, cut up on one side to allow of the gallery. The plan is open to all the objections of the first three, with the addition that only one entrance is provided, and the staircase forms too much a part of the assembly-hall, while the gallery also would add to the disturbance. "Tudor" draws nicely. "Ionic" also is a good draughtsman. His plans are very indifferent, with one stairway and the master's room poked away out of sight. The author does not appear to have realised how school work has to be carried on. He makes his cloakrooms passageways, which is not allowable. We like his exterior design very well, and shall expect him to do better than this. "Digneori" does steer clear of some of the greater defects already alluded to, and he gives better cloakroom space and a head-master's room on the ground floor. He forgets that through ventilation is needed in cloakrooms, and he locates his preparation-room beyond the chemical laboratory, with no other access to it. The lecture-room is isolated from both, and the only way to the art-rooms is through the assembly-hall. The elevations are among the best. "Victis," too, is rather good in this respect, and he provides two staircases; indeed, he would have ranked much higher save for the objection which exists in consequence of the impossibility of reaching the second staircase except by passing through the first-floor rooms. The ground-floor is better; but the cloakrooms, which are in the basement, are too small. "Doublee" has several good points, and avoids the objections noted in the last scheme; but his hall is 27ft. high, with a roof above that which opens to the apex, which is a fault. There is only one main entrance, and as the masters' rooms are on either side of it, the noise of the pupils leaving school would be a serious objection. The cloakroom is too limited, and the boys' door in the basement being reached by the stairs next the head-master's room does not obviate the noise question just referred to. The elevations are plain and straightforward. We for some reasons prefer "Stoop"; but he runs his assembly-room half under the first floor and half outside, at right angles with the main block. The seating to classrooms is not shown, and the fireplaces are wrongly placed to allow the seating to come properly. The corridors would be very dark, and there is only one staircase. "Jingo" has a far better plan, spoilt by a too spacious entrance-hall with one staircase only. The boys' entrance is convenient, and the first floor is really in some ways good, though the end of the corridor should have been open for light; and the preparation-room is too small. Externally the design is commonplace, and panelled classrooms are beyond school builders' means. "Stoney" puts his hall on the first floor, and spoils his classrooms by giving them canted ends for external appearance, which would be better

really than the perspective suggests, with its turnip-field trees. "Ghost" has a nice plan of the elementary school type, with the entrance at one end of the central hall; but he has put the masters' rooms on the first floor, away from all supervision, and gives us narrow corridors which we do not much like. The elevations are above the average, and are really well drawn, though the perspective sketch is poor. "Yew Tree" is not so successful, and his head-master's room is very small; but the cloakroom is much more the sort of thing needed. The landing upstairs is shockingly wasteful, and the physical laboratory is correspondingly small. This contributor ought to do better, and he draws feelingly. Let him omit trumpery eye-slits for windows in the roofs. "Old Mereer" has notions, and adopts simple detail, which is an advantage. His canted porches are lumpy in their proportions, and ugly. The life classroom on the ground-floor room taking its position in a line with the ordinary classrooms is a mistake—would be a long way off the other art-room upstairs. There are two staircases, and a good covered playground. The view is mechanically delineated. "Plumbob" shows a regulation type of board school building in style, and the hall is on the first floor, with a central staircase, top-lighted, and the laboratories on the ground floor. The perspective is not attractive. "D'Artagnan" has an arcaded hall, with a staircase rising up out of one end without much idea of contrivance; while in the middle of one side is an entrance to the "grounds" flanked by masters' rooms, without any cloakroom convenience. The boys' cloakroom is at one end of the school and their lavatory at the other. "Regent" has a fairly good rear elevation, with an arcaded playing shelter, but the detail is poor, and the plan is crude. "The Magpie" goes in for coarse features and heavy masonry, better adapted to bridge building. The plans are ordinary, having a central hall with galleries all round. "Norseman" has a better plan than elevation. He has taken some pains to furnish his laboratories, but omits the classroom seatings and fireplaces. "The New Boy" takes a lot of trouble, but is not simple enough, going in too much for octagonal-shaped classrooms and bay's and splay-arranged doors. His south-east front is pretty, and might do for a vicarage. "Orehid" is next in the list with a cloakroom put in place of a classroom out of the assembly-hall, which runs up through both floors. The building is not well adapted to a school. "Architect" will never deserve the name if he does not do better than his present design. The plan is disconnected and broken into by a big staircase out of the central hall. The front porch is mere pettifoggery work. "Adze's" hall is upstairs, with one laboratory down below and the other above. The cross-passages on the ground floor are very dark and bad. "Frena" has one staircase and an open-timbered roof to his assembly-hall. There are good points in his plan, but the contrivance is very mixed, as in the last named. "Liver" is an indifferent penman, with little notion of school-planning. The front elevation is picturesque. "Leo" has two square-topped six-sided towers, giving a church-like character to a poorly-planned school. "Blackheart" draws in a thin fashion, and has sprawling, segmental-arched windows, divided by buttresses. He makes a feature of an emergency exit. All is on the ground floor except the art-rooms. The masters' rooms are mere boxes. We cannot find space to particularise more of the designs in detail, as they are so numerous and so indifferent. They come in this order:—"Fenland," "Broad Arrow," "Pip," Southampton; "Tender Foot," "Ydol," "Black and White," "Wee Macgregor," "Inside Right," "Cast," "Pip," "S. H. S.," "Free Trade," "Cedric," "Clerk of Works," "Cave Canem," "Chin Chin," "Sandy," "Inca," "Marcus," "Quail," "An Old Scholar," "Puck," "Young Michael," "St. Nicholas," "Eurymedon," "Jap," "B.," "Putre Sens," "O. K.," Musselburgh; "Obelisk," "Zorcolo," "Criss Cross," "Fido," "Arabi Tang," "Sir Toby," "Humber," "Specs," "Quatre Vois" (unfinished), "White Rose," "Midnight Oil," "Autocar," "Primus," "Omega," "Cleddady.".

The foundation-stone of a new school for St. Saviour's, Norwich, was laid on Friday by the Bishop of Norwich.

NEW OFFICES OF THE OCEAN AND GUARANTEE CORPORATION, LTD., BELFAST.—"THE RESURRECTION OF THE DEAD," WEST FRONT, WELLS CATHEDRAL.—DALE SIDE, HARROGATE.—ST. GERMER (OISE).—"BUILDING NEWS" CLUB DESIGNS FOR A SECONDARY SCHOOL.

Our Illustrations.

NEW OFFICES OF THE OCEAN ACCIDENT AND GUARANTEE CORPORATION, LTD., BELFAST.

The new buildings erected in Belfast for the Ocean Accident and Guarantee Corporation, Ltd., Moorgate-street, E.C., are situated at the junction of Donegall-square East and Chichester-street, facing the city hall. Emphasis is given to the principal angle by the tower which rises to the height of 125ft. The work externally is of red sandstone from Ballochmyle, Ayrshire, with red tiled roofs. At the main entrance is a boldly projecting balcony carried on fan groining. Coonemra green marble is used for the columns at doorway, and the arch above is enriched with carving, including life-sized heads of the King, Queen, and late Queen Victoria. On the Chichester-street front is placed a canopy with the name of the corporation in bronze letters. A large safe deposit constructed by the Ratner Safe Company, Ltd., Moorgate-street, E.C., occupies the main basement, and can only be approached through the offices, which are fitted up in mahogany with large chimneypieces of Bath stone. This is the first safe deposit built by the Ratner Co. in Ireland, and is of the most up-to-date construction. The outer shell is composed of drill-proof compo. steel, constructed in the strongest possible manner. The doors are of the most improved construction, composed of metal at once undrillable and unbreakable, whilst the bolt work and locks of the doors are of the highest class. In addition to the offices of the Ocean Corporation are several shops, and the remaining floors of the building are let out in offices approached by marble-lined vestibule with stone staircase and electric lift. Messrs. Robt. Corry, Ltd., are the contractors, and the architects are Messrs. Young and MacKenzie, Belfast.

"THE RESURRECTION OF THE DEAD," WELLS CATHEDRAL.

The west front of this grand church was designed, like that of Lincoln and Salisbury cathedrals, with the intention of providing a field on which to display a grand scheme of figure sculpture. Bishop Jocelyn commenced the Wells façade on his return to England in 1218, and his evident purpose was to throng the whole front with statues; but in doing this he avoided all imitation of the great portals of Paris, Rheims, and Amiens, then in course of erection. The west door at Wells is, relatively speaking, exceptionally small, even among English cathedrals, and it was so contrived in order that it should not interfere with the sculpture scheme. The great north porch forms the main entrance to the cathedral, and this western portal gave access to the burial ground in front of the building. The sculptures which we illustrate to-day are situated high up, as a sort of frieze, ranging in niches above the recessed windows

and tiers of statues with which the façade is covered, and the returns are furnished by the divisional piers, or buttresses, which constitute such an important feature in the design of this exquisite building. The figures are shown bursting from their graves to life eternal on the summits of the Judge of All, who in Majesty is represented in the crowning group of sculpture which occupies the central gable above. The undraped figure-work of the 13th century sculptors contrasts in a marked degree with the delicate suggestions of human anatomy which distinguish the draped statues of this front as elsewhere. The crude shapings of these nude figures is very noticeable, though their action is spirited and dramatic. Many of them are dignified, and an exceedingly difficult problem has been realised in a grand way, which at the same time tells its own tale without hesitation and without encroaching upon the architectural lines of the recesses which inclose these carvings. Even where the coffin lids are introduced, they are handled with much skill and simplicity. Being situated a great distance from the ground, the breadth of the treatment of these groups is of immense value, and the effect, of course, is very different from that obtained by the close examination which photographs taken from a scaffold render possible. These sculptures are among the earliest of their kind in England, and certainly are among the best which we have to show of detached figure carvings leading up to the statues which in all probability were subsequently added as the work proceeded. The date of this work is given as 1220 to 1230; but some of the figures possibly are later.

DALE SIDE, HARROGATE.

These interiors are from a recently-erected house at Harrogate, designed by Mr. F. Rowntree, architect. The exterior is picturesquely treated, and a feature is made of the hall out of which the staircase rises. The lower picture on our plate shows this apartment, and the upper photograph illustrates the boudoir, which has a basket grate to the fireplace with doors or shutters to regulate the draught.

CHURCH OF ST. GERMER (OISE).

I SEND photos of the north and south aisles of the church at St. Germer (Oise), in which William the Conqueror swore to hold England as a fief of the French crown if he succeeded in conquering it. They are interesting architecturally and historically.

CHIPS.

The next meeting of the Auctioneers' Institute will be held at Hamilton House, Victoria Embankment, on Wednesday next. Mr. W. F. Webster, M.A., will read a paper upon "Particulars and Conditions of Sale." The chair will be taken by the president, Mr. J. H. Townsend Green.

Major C. E. Norton, R.E., held an inquiry at Todmorden Town-hall on Thursday in last week with reference to the application of the corporation for permission to borrow £27,274 to meet the cost of providing a refuse destructor, an electric lighting station, &c.

The inauguration of the new waterworks for Southborough, Kent, which are situated at Upper Haysden, and by which it is estimated the local yield will be increased to 120,000 gallons per day, took place on Thursday in last week. The total cost of the works is approximately £18,000.

The inauguration of trams on the London-road, Brighton, and the transfer of the terminus in front of the north gate of the Pavilion to the Old Steine, close to the Aquarium, took place last week.

The men's lodging-house erected on the Mill-lane Estate, Deptford, is reported by the Housing Committee of the County Council to be practically complete. It is to be opened to-morrow (Saturday) by Countess Carrington, and will be known as Carrington House.

Messrs. J. B. Joyce and Co., Whitchurch, Shropshire, have just completed the fixing of a large striking clock with three illuminated dials at Wootton Hall, near Ashbourne, Derbyshire, for the Hon. Henry Bourke. The same firm have also fixed an extra large quarter clock at Stobhill Hospital, Glasgow, which shows time upon four illuminated dials, 1ft. diameter. They are made to designs laid down by Lord Grimthorpe.

COMPETITIONS.

ACTON.—The county council of Middlesex invited the following architects to submit designs for their county school at Acton—viz., Messrs. Maurice B. Adams, Felix Clay, B.A., Giles, Gough and Trollope, Pratt, W. Pywell, Osborne Smith, and A. H. Tiltman. Mr. Leonard Stokes acted as referee, and the governors have adopted his report, by which Mr. Tiltman's design was chosen for execution, and the premiums awarded were given to Mr. W. Pywell, of Hanwell, and Messrs. Giles Gough and Trollope, of Charing Cross. The cost was set down at £8,000 in the instructions as a basis, but the requirements were in excess of that amount.

BRIGHTON AND HOVE HOSPITAL FOR WOMEN.—There are upwards of 60 sets of designs sent in for this competition, and it is expected the adjudication will proceed at once.

NEW HOSPITAL FOR AYR DISTRICT ASYLUM.—The Ayr District Lunacy Board have now selected a design for carrying out the proposed new hospital at their asylum. Twenty designs were submitted for the work, and were reported upon by Mr. Sydney Mitchell, architect, Edinburgh, as assessor. The board offered three prizes of £75, £50, and £25. The assessor placed the designs as follows: First prize, Mr. John Arthur, 131, West Regent-street, Glasgow; second prize, Mr. J. K. Hunter, architect, Ayr; third prize, Mr. John B. Wilson, 92, Bath-street, Glasgow. After considering the designs in view of the measurer's report, the board have selected the design presented by Mr. John B. Wilson, which, it will be seen, was placed third by the assessor.

RAWNSTALL.—Twenty-nine designs have been received for the "Carnegie" Library at Rawntall, and they are said to be on the whole above the average in merit. Messrs. Butterworth and Duncan, architects, of Rochdale, have been appointed assessors. The premiums are £100, £50, and £30 respectively for the three designs placed for premiums. The plans are to be on view on the 20th and 21st at the Liberal Club, Rawntall.

ST. ANNE'S-ON-THE-SEA — PROPOSED FREE LIBRARY.—At a meeting of the General Purposes Committee of the St. Ann's Urban District Council, the clerk reported that the sites sub-committee had had under consideration the question of the erection of the Carnegie free public library and of public baths. With regard to the latter the sub-committee had not as yet completed their inquiries; but as regards the former they recommended that competitive designs be invited from local architects, and that premiums of £20, £10, and £5 be offered for the best designs sent in. They further recommended that the author of the selected design carry out the works at an inclusive fee of 7 per cent. (the amount of the premium to merge into and form part of the commission) on the cost, the fee to include the preparation of plans, sections, estimates, the measuring up of the work, getting out quantities, and all other work in connection therewith. According to a report to hand, the committee further recommended:—"No commission of any kind is to be received by the architect from the contractors, or any of them," and the library outlay, including furnishing, architect's commission, and all other costs and expenses in connection therewith, is not to exceed the sum of £3,500. It is difficult to believe that such an insulting stipulation as that italicised by us could be made by any responsible public body, and we trust "the local architects" invited to compete will combine and insist that the clause is expunged from the conditions before consenting to compete.

THE NEW TOWN HALL FOR STOCKPORT.—The Town Hall Committee of the Stockport Corporation on Wednesday received the report of the assessor appointed to award the premiums offered for plans for a new town hall and municipal buildings. The awards were as follows:—1, £100, Mr. A. Bramwell Thomas, London; 2, £75, Messrs. Woodhouse and Willoughby, Manchester; 3, £50, Mr. H. T. Hare, London; 4, £50, Mr. C. R. Locke, Stockport; 5, £50, Messrs. Briggs and Wolstenholme, Liverpool. The Committee fixed the limit of cost at £60,000.

The Bishop of London dedicated, on Wednesday, the new church of St. Martin's, West Acton, which has been erected on a site given by Mr. J. Reaud, M.P. and accommodates 500 persons.

LONDON TRAFFIC COMMISSION.

THE Royal Commission on London Locomotion again sat at the Westminster Palace Hotel on Thursday, Sir David Barbour presiding. Mr. Andrew Young, valuer to the London County Council since 1899, and before that valuer and surveyor to the London School Board, gave further evidence on behalf of the London County Council. He believed that the only economical method of carrying out street improvements in London was by laying out the projected new streets in such a way that it would not be necessary to acquire a large proportion of valuable property occupied for business purposes, but where practicable they should be carried through property of an inferior class where the formation of a broad thoroughfare would not only be possible at much less cost for property, but would by facilitating ventilation and opening up the district improve the condition of it from a sanitary point of view. A proposal under consideration was the construction of streets at a greater width than any hitherto projected in London—namely, 160ft. which must involve outlays of great magnitude. The effect of any such construction would have the effect of generally and enormously raising the value of property in the remoter districts, which it would bring more closely into touch with Central London. If the proposal were further extended so that there should be special means of locomotion by surface tramways, motor, and other fast traffic, and by tube railways, the possibilities for recoupment would not only be increased but would extend over large areas of these remoter districts. The approximate estimated cost of the proposed new thoroughfare in continuation of the Holborn to Strand improvement—across the Thames, through Southwark, Bermondsey, and Camberwell, to the Crystal Palace was twelve millions. The line of route was 6½ miles in length, and he had included an area of land 150ft. deep on either side of the proposed thoroughfare. A considerable portion of the £12,000,000 would be recovered by the sale of the surplus property. As Parliament required that fresh house accommodation should be provided, the difficulty of carrying out such a scheme would be greatly enhanced, and more than 41,000 persons would be displaced. To provide accommodation for these would necessitate the acquisition of a site or sites of over 200 acres. Any such new streets should as far as possible take the form of new thoroughfares, and not merely widenings. Mr. Young next gave figures as to the cost of the Holborn-to-Strand improvement, and he was sanguine that the net cost of property for this improvement was likely to be less than the original estimate. Sir Alexander Bruce, Assistant Commissioner of Metropolitan Police, gave evidence on Thursday and Friday. He said that, owing to the mode of growth of London, there was an absence of plan in the construction and arrangement of streets, and no adequate provision had been made for growing needs. With a few notable exceptions the streets were as narrow and irregular now as they were 100 years ago, while the traffic had increased at an enormous rate, especially during the last quarter of a century. For the obstruction caused to traffic by the breaking up of roads, there seemed to be but one effective remedy—that of providing subways carrying all pipes, sewers, &c., so that they could be got at without interfering with the surface of the roads. With respect to tramways, he considered that tramway routes and termini had not always been fixed with due regard to the convenience of the public. One remedy for such a state of things was to have the termini in by-streets; and another was that the tramway should, instead of stopping as it did now, go off at some by-street, form a loop, put down its passengers, and then come on to the main line. From a public point of view, the chief hindrance to a steady flow of traffic was cross traffic. So long as a street had other streets running into it, carrying cross traffic, there must be frequent compulsory stoppages, and resulting annoyance and delay. Subways or bridges might be provided for pedestrians; but it was not easy to see how this could be done in the case of vehicles. It was for engineers to say whether or not it was possible. The commission adjourned.

Mr. Bertram Hopkinson, of Trinity College, was on Saturday elected Professor of Mechanism and Applied Mechanics at Cambridge University, in the place of Mr. J. A. Ewing, resigned. The new professor is a son of the late Dr. John Hopkinson, and the stipend is £700 a year.

OBITUARY.

THE death occurred on Monday, at Vienna, of Herr KAMILLO SITTE, a prominent architect and writer on art topics, in his sixtieth year. He was the author of the work entitled "The Construction of Cities upon Artistic Lines," which has recently been translated into French and English.

PROFESSIONAL AND TRADE SOCIETIES.

ARCHITECTURAL ASSOCIATION OF IRELAND.—A visit by members of this association was paid on Saturday afternoon to the New Nurses' Home in connection with Cork-street Hospital, Dublin. Good muster of members turned up for the occasion, including Mr. C. H. Ashworth, the president, and Mr. J. H. Webb, the hon. sec. of the visits committee. The visitors were received by the architect to the building, Mr. W. M. Mitchell, R.H.A., who having exhibited the drawings and made a brief explanatory statement, afterwards conducted them through it, pointing out the various objects of interest therein. The new home is very advantageously situated opposite the Hospital, with Cork-street intervening. The main front enjoys a sunny aspect overlooking a lawn of considerable extent bordered by trees which was formerly used as the burying ground of the Society of Friends. No internments, however, have taken place there for nearly half a century, and it will shortly be transformed into a verdant garden for the rest and refreshment of the inmates after their arduous duties at the hospital. Accommodation is provided in the building for about fifty nurses, each having a separate bedroom, while large airy dayrooms occupy the ground story. The floors, partitions, &c., are fireproof throughout, and an external wrought-iron staircase is provided for emergencies. The entire building is heated by hot water, and electric lighting has been adopted. The sanitary wing, which is connected with the main building only by a corridor having cross-ventilation, is fitted with the most approved type of baths, lavatory basins, &c. The building and sanitary contractors respectively are Messrs. H. and J. Martin and Mr. R. MacGarvey, both of whom have given great satisfaction, while Mr. Hynes, the clerk of works, efficiently discharged the duties of his office.

THE EDINBURGH ARCHITECTURAL ASSOCIATION: ASSOCIATES' SECTION.—This association met on the 11th inst. at 117, George-street, Mr. J. A. Arnott in the chair. Mr. Ramsay Traquair delivered a lecture on "Notes on Later Scottish Gothic." The lecturer traced shortly the rise and progress of Gothic work in Scotland, pointing out the manner in which the earlier English style was replaced by a mixed school influenced both from France and England. Great stress was laid on the need of studying the simpler examples of the earlier style as a base on which to raise new ideas. A number of characteristic buildings of the "Later Decorated" period were described. The paper was illustrated by lantern slides.

MANCHESTER SOCIETY OF ARCHITECTS.—On November 12, Mr. Alfred E. Corbett, A.R.I.B.A., read a paper on "Modern Domestic Architecture." Mr. Corbett said that the advance during recent years in the art of architecture had been greatest in domestic work, and had been largely influenced by the feeling that modern architecture must be founded more on sound and straightforward construction, and the suitable treatment of materials, than on the forms of buildings erected to fulfil the requirements of some bygone century; although careful study of these old buildings is a necessity to every architect. Noting various points as to the choice of materials and methods of construction, stress was laid on the advantages of solid construction of floors, &c., and detail given of some varieties of solid concrete or wooden floors. A double cavity wall was mentioned as probably having some advantages. Speaking of various treatments of wall surfaces, half-timber work, when used merely as a casing in front of a brick wall, was condemned as being a useless, and more or less perishable, deception. The aspect and planning of the chief rooms, and of the house as a whole, were briefly commented on, and illustrated by examples of plans by Mr. Norman Shaw and others. Referring to the external treatment it was insisted that the scheme must be mentally realised as a combination of materials of certain colours and textures, not merely as a pleasing arrangement of lines on paper; and that local material should generally be preferred. While

moulded brick is a useful material, terracotta was thought to be quite unsuitable for country houses. The remainder of the paper consisted of comments on lantern slides, showing over fifty views and plans of good modern domestic work by leading architects. After a few words by Mr. J. W. Beaumont, the president, a vote of thanks to the lecturer was proposed by Mr. W. A. Royle, and seconded by Mr. J. S. Hodgson. At the same meeting the names of the following prize winners were announced:—For the best work in the R.I.B.A. classes: First year course, Mr. R. J. Vernon, prize value £4 4s.; second year course, Mr. Sidney Moss, prize value £1 4s. For the best work in the evening classes of design: Mr. H. B. Laycock, prize value £4 4s. Mr. Beaumont's prize, value £5 5s., for measured drawings for the sketch-book: Mr. Claude Paterson. Set of sketches in connection with summer visits: First prize, value £3 3s., Mr. Frank Dyer; second prize, value £1 1s., Mr. J. H. Somerset. Measured drawings of old work: First prize, value £3 3s., Mr. J. H. Somerset; second prize, value £1 1s., Mr. R. J. Vernon. Commentary on map of interesting buildings of the neighbourhood: Prize value £1 1s., Mr. Spencer H. Oldham. Design for window and balcony: Prize value 10s. 6d., Mr. C. Norman Taylor.

NORTHERN ARCHITECTURAL ASSOCIATION.—The opening meeting of the winter session of this association was held on Friday at the offices in Northumberland-street, Newcastle, the President, Mr. J. Walton Taylor, F.R.I.B.A., in the chair. The trust deed for the gift of £1,500 to the association by Mr. W. Glover, F.R.I.B.A., of Windsor, an ex-president of the association, and formerly of Newcastle, was read. Ald. W. H. Dunn was elected as an honorary member of the association in recognition of past services, and thanks were expressed to Mr. H. C. Charlewood, F.R.I.B.A., for presenting to the library a copy of "Wymondham Church, Norfolk." The president, in his inaugural address, referred to Mr. Glover's gift, and then went on to speak of the year's progress in buildings, and showed a set of plans, the original ones of Mr. Richard Grainger, for laying out the central part of Newcastle. Speaking of the development of the suburbs, and referring to the Bourneville and Port Sunlight schemes, Mr. Walton Taylor said in his opinion the Corporation of Newcastle were acting wisely in erecting two-story dwellings in tenements on the line of the electric tramroads so that those who used to live at a cheap rate could do so, and readily remove from one shippard or works to another. Besides, the facilities for travelling in workmen's cars were so great that there should not be any difficulty in men getting quickly to their work in any weather. In fact, the quick and frequent electric tram and train service promised to be the solution to a great extent of the housing problem. For those who would not remove from the slum he would suggest the course adopted by the Borough of Camberwell, where the Borough Council bought the houses and adapted them into healthy tenements—an experiment which had raised the standard of house accommodation, and which had been a great success, being entirely self-supporting and not costing the ratepayers a penny.

A second Local Government Board inquiry into the application of the Maidstone Town Council for a loan for the treatment of the sewage of the town by the bacteriological system was held at the town-hall on Friday, the proceedings occupying upwards of six hours. The inquiry was conducted by Mr. H. R. Hooper, M.A., M.I.C.E., and the council sought permission to raise a total loan of £78,000, spread over the longest possible period. Mr. George R. Strachan, M.I.C.E., the engineer consulted by the corporation, explained the proposals, to which considerable opposition was offered on behalf of the Marling Rural Council (who called Professor Henry Robinson, M.I.C.E.) and local landowners.

At the inquest, on Monday, on the labourer, Oram Parsons, killed in a lift accident at the Savoy Hotel extension, evidence was given by Mr. A. C. Baird, mechanical engineer, in the service of the London County Council, that the lift rope was deteriorated and in poor condition. The jury, in returning a verdict of Accidental Death, stated that the rope, which broke, was not properly examined by qualified persons.

The annual distribution of prizes at the City Companies' Trades Training School in Great Titchfield-street, W., will take place on Wednesday, Dec. 9. The prizes will be presented by the Right Hon. Lord George Hamilton, M.P.

Building Intelligence.

EXETER.—The first section of the new electricity station at the Basin was opened by the Mayor on Monday. In March the city will be entirely supplied from the new station, and everything now done in the works in New North-road will be transferred to the Basin works. The new station has cost altogether £14,000. The contractors are Messrs. W. Brealy and Son, St. Thomas, Exeter, and the architect is Mr. D. Cameron, of Messrs. Cameron, Commis, and Martin. The engine-room is 105ft. by 45ft., and height 50ft. The room has a face of glaze bricks of French grey, with chocolate dado. There are engine-rooms, boiler-room, coal-stores, repairing shops, offices, economising chamber, pump-rooms, lavatories, &c. The electric installation is by the British Westinghouse Company, and the sub-contractors are Messrs. Babcock and Wilcocks and Messrs. Willey and Co. The architect has been represented at the works by Mr. H. W. Bulley; the clerk of works is Mr. F. Smith. On the chief front are two life-size figures representing Science and Art, and also a panel containing the arms of the city; these have been carried out by Mr. E. T. Rogers, of Sidwell-street, Exeter.

LONDON COUNTY COUNCIL.—At Tuesday's meeting of this body, the Highways Committee submitted an amended scheme in reference to the acquisition of the undertaking of the London Southern Tramways Company, involving an estimated net outlay of £375,000. In the course of a discussion, Lord Welby urged caution before the Council committed itself to further large expenditure. The committee's recommendations were ultimately adopted. It was agreed to abandon the following four projected tramway schemes on account of the refusal of the local authorities to contribute to the necessary street widenings—viz., Hop Exchange corner to Lambeth Palace-road, Shepherd's Bush-road to a point near the Marble-arch, Battersea-park-road to King's-road, Chelsea, and Tooting High-street to the new county boundary. On the recommendations of the Highways Committee it was agreed that for the purpose of the early reconstruction for the conduit system of electrical traction of the first 22½ miles of the Council's northern tramways and for lines in the south, tenders be invited for 12,500 tons of rails, conductor tees, fastenings, &c., at an estimated cost of £90,000. An estimate of £13,850 for the purpose of constructing new termini at Tooting was agreed to.

LUTON.—The opening of the Bury Park Congregational Church, Luton, Beds, took place on Thursday afternoon last. The building is designed in Perpendicular Gothic, freely treated. A bold square tower forms a prominent feature at the corner of the block. The accommodation provided is as follows: 468 adults on ground floor, and 65 in end gallery—total 533, or a mixed congregation of about 610 persons. The buildings to be faced with red brick, with Bath stone dressings. Joinery internally stained transparent green, and wax-polished. Red granite columns supporting four crossing arches. Lead-lights richly coloured. Green slates. Heating by low-pressure pipe apparatus, and the best ventilating appliances. The contract is let to Messrs. T. and E. Neville, of Luton, and amounts to £4,429. The architects are Messrs. George Baines, F.R.I.B.A., and R. Palmer Baines, 5, Clement's Inn, Strand, London, W.C.

Under pressure from the Board of Trade, the Acton Urban District Council appointed, on Monday, Mr. W. H. Trentham their electrical engineer for three years. The council decided upon the use of steam for the generation of electricity, and referred to Mr. Trentham the desirability of having a combined scheme of electric lighting and dust destructor works, the Local Government Board having already given their sanction to a site for the latter at Bedford Park. The expenditure involved is estimated to exceed £100,000.

Mr. Samuel Henry Turtle, of Messrs. Turtle and Wood, builders, St. John's-road, New Wandsworth, who died on October 20, bequeathed all his property, on the death of his mother and his brothers and sisters, for the furtherance of the Gospel of Jesus Christ, a sum not exceeding one-fourth thereof to the Battersea Chapel Sunday-school, and one-half the residue each to the Baptist Building Fund and the London Baptist Association Sites Fund. The value of the property is £53,561 9s. 5d. gross, and £50,364 19s. 4d. net.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, Clement's House, Clement's Inn Passage, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAHO NEWSPAPER COMPANY, LIMITED.

Telegraphic Address:—"Timeserver, London."
Telephone No. 1633 Holborn.

NOTICE.

Bound copies of Vol. LXXXIII. are now ready, and should be ordered early (price 12s. each, by post 12s. 10d.), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLVI., XLIX., LIII., LXI., LXII., LXIV., LXV., LXVI., LXVII., LXVIII., LXIX., LXXI., LXXII., LXXIII., LXXIV., LXXV., LXXVI., LXXVII., LXXVIII., LXXX., LXXXI., and LXXXII. may still be obtained at the same price; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Handsome Cloth Cases for Binding the BUILDING NEWS, price 2s., post free 2s. 4d., can be obtained from any Newsagent, or from the Publisher, Clement's House, Clement's Inn Passage, Strand, London, W.C.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.). To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Situations and Partnerships.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" and "Partnerships" is ONE SHILLING FOR TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

* Replies to advertisements can be received at the office, Clement's House, Clement's Inn-passage, Strand, W.C., free of charge. If to be forwarded under cover to advertiser an extra charge of Sixpence is made. (See Notice at head of "Situations.")

Rates for Trade Advertisements on front page, and special and other positions, can be obtained on application to the Publisher.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

Correspondence.

ARCHITECTS' SECRET COMMISSIONS.

To the Editor of the BUILDING NEWS.

SIR,—This week the profession in London has been favoured by circulars inclosing a souvenir of a billiard championship match accompanied by this offer:—"Should our large illustrated list be of service to you we shall have pleasure in sending same, and in the event of business, we should, of course, recognise the usual architect's remuneration!" The point of the whole thing is in the line which put in italics, please. I do not suppose these enterprising people thought much of the insult thus offered to honest men. The proposal is not often made, however, in such direct terms; but in other catalogues lately issued at great expense, and sent to architects, additional pocket information is furnished, showing how second discounts are obtainable, and which need

not appear on the surface from the bare statement of provisional amounts in specifications. Of course, if questioned adversely, the way of retreat is afforded by the excuse of custom in trade. Wisecracks with business heads on their shoulders, when they hear of these things, with a credulous look assure you that "Of course these things are done," in recognition, I presume, of "the usual architect's remuneration." "Not likely anyone's going to tell" of such nefarious transactions. I have known as many architects as most people; but although this subject crops up every now and again, I doubt if it obtains, at any rate in any appreciable degree, amongst recognised men. Still, I am bound to realise that these suggestions actually made indicate a style of business which is most objectionable, and any firm adopting it ought to be tabooed by all decent architects.—I am, &c., A FELLOW OF THE INSTITUTE.

THE LATE MR. A. J. BARLOW: A CORRECTION.

SIR,—Will you kindly correct an error made in your issue of Nov. 6, top third col., p. 609? You wrongly announce the death of Mr. Arthur Edward Bartlett, who is alive, and is anxious for this report to be contradicted. The name should have been Arthur Job Barlow, A.R.I.B.A.—I am, &c., W. J. LOCKE, Secretary.
9, Conduit-street, London, W., Nov. 17.

Intercommunication.

QUESTIONS.

[12023.]—**Breaking Strain.**—Can you tell me the breaking strain and safe load of steel girder 10ft. long, flange 3in. thick, 6in. between flanges? And what would be break and safe load on the flanges only?—FAIR MAIR.

[12024.]—**Rainwater.**—In what way can I store and filter rainwater from flat roof of proposed small bungalow in country district—for drinking and other purposes? Also best arrangement for closet and drainage. There are no sewers in neighbourhood.—A. B.

[12025.]—**Ancient Lights.**—In Prof. Banister Fletcher's book on "Light and Air," he says that by blocking up an adjoining owner's ancient lights for twelve months the said owner's lights are lost, even though the obstruction should be made surreptitiously, as it were, without the dominant owner's knowledge. On what authority is this based? As in cases of alleged abandonment of lights cited by the same author, it appears to have been necessary to prove intention of abandonment by the dominant owner before the lights could be lost?—LIGHT AND AIR.

[12026.]—**Baker's Oven.**—Can any reader of the BUILDING NEWS inform me how to build a baker's coal "flush oven"? Small sketch or plan and section.—BAKER.

REPLIES.

[12022.]—**Worms in Wood.**—Corrosive sublimate solution usually applied.—REGENT'S PARK.

CHIPS.

The Paviers' Company will hold an exhibition on Monday next at the Guildhall, E.C., in connection with their recent competition for essays on the question of the provision of street subways.

The Great Central Railway Company have taken definite steps towards the commencement of the erection of waggon works at Dukinfield, where they recently acquired 27 acres.

A Wesleyan church parlour was opened at Manningtree, Essex, on Wednesday week. Mr. J. W. Start, of Colchester, was the architect, and Messrs. Sage and Cutting, of Wix, were the contractors.

The parish church of Buxhall, Norfolk, was reopened last week after restoration, including the rebuilding of the porch and repairs to the nave. Messrs. Rattee and Kett, of Cambridge, were the builders.

The Teimouth Urban Council have completed negotiations for acquiring part of the well-wooded grounds of Bitton House as a public pleasure ground. The mansion stands between a main street and the River Teign, not far from West Teignmouth Church and a little above the quay, and a portion of the estate has been built over.

A new Wesleyan Church at Talbot-lane, Rotherham, which has been built on the site of the old chapel burnt down in November, 1901, was opened on Friday. The new church is the third place of worship on the same site. The first was an octagonal chapel in which John Wesley preached several times. The new building is modern Gothic in style, and will accommodate 860 worshippers. The cost has been £11,500, which includes £1,000 for the organ. The architects are Messrs. W. J. Morley and Son, of Bradford, and the contractor is Mr. Robert Snel.

WATER SUPPLY AND SANITARY MATTERS.

LITTLEHAMPTON.—The Littlehampton Urban District Council are proposing to carry out a gravitation, bacterial, and pumping system of sewerage for the northern portion of the town, also for the district of Wick. The works are estimated to cost £10,318, towards which his Grace the Duke of Norfolk has proposed to make a contribution of £3,000. A scheme is under preparation for these works by the council's surveyor, Mr. H. Howard.

LEGAL INTELLIGENCE.

EXTRAS ON BUILDING CONTRACTS.—In the Appellate Court, Glasgow, on Friday, Sheriff Guthrie gave judgment in an appeal against the decision of Sheriff-Substitute Balfour in an action at the instance of Messrs. William Shaw and Son, contractors, 94, Commerce-street, Glasgow, against Messrs. Ferguson and Forrester, Ltd., 36, Buchanan-street, Glasgow. Pursuers contracted with defenders to carry out alterations upon the underground portion of defenders' premises for £4,746 12s. 3d. While the work was in progress pursuers encountered unlooked-for difficulties. These difficulties increased the cost of alterations to £7,821 3s. 11d., and it was for the difference between this sum and the sum contracted for that pursuers sued. Sheriff Balfour gave judgment in favour of the pursuers to the amount of the sum sued for, holding that, though the work executed was not all included in the estimate, it largely consisted of extras, ordered either by defenders or by Mr. George Bell, architect. Sheriff Guthrie has adhered to this decision. In a note, his Lordship says it might not perhaps be wise in all cases for owners of property to put themselves entirely into the hands of their architect; but if they did so they had themselves to blame, and if the architect exceeded his powers in dealing with contractors who had been allowed, as in this case, to suppose that his powers were unlimited, the remedy was against him, and not against the innocent contractor.

CLAIM BY A SOUTHAMPTON MODELLER.—Michael Gargano, plaster manufacturer, of St. Mary's-road, Southampton, sued Messrs. T. and E. W. Jenkins, builders, of St. James-street, Newport, Isle of Wight, in the Southampton County-court, to recover the sum of £30 4s. 5d., for work done by him and materials supplied. Mr. Hiscock, for the plaintiff, stated that the claim was in respect of work done and goods supplied in the shape of modelling and making certain enrichments supplied to the defendants, who had a contract in the Isle of Wight. The sole question was that of amount, the defendants alleging that the plaintiff had grossly overcharged them. The defendants had paid the sum of £5 into Court. Frequent communications were sent to the plaintiff to get him to hurry on the work, and he sent over the goods as instructed by the carriers, and invoices accompanied each consignment. Defendants afterwards complained of overcharge. Plaintiff denied having overcharged, and ultimately offered to take £20 in settlement, but could not get that. The work that had to be done was difficult. Plaintiff gave evidence, stating that he had carried on business in Southampton for 16 years. He had to work a deal of overtime. Although he sent in invoices work kept coming in, and no complaint was made of the charges until the last work was done. Edgar William Jenkins, one of the defendants, stated that the charges were too high. Antonio Marchi, a plasterer and modeller, of Pokesdown, Bournemouth, estimated £9 12s. 8d. as the amount he would do the work for, and which would give him a fair profit. John Frank Crook, quantity surveyor and estimator, Southampton, stated that he had been connected with the building trade and work for 33 years. He was instructed by the defendants on Saturday to estimate for certain modelling work, and he gave particulars as to prices, his Honour remarking that it was very different to that of the last witness. Mr. Crook said no doubt he could have got the work done for £15, and £30 was too much. His Honour said the last witness had only seen so many foot run, and did not know the pressure put on the plaintiff by the postcards and the extra hours that had to be worked to do it. He gave judgment for the plaintiff for the amount claimed, and costs.

The town council of Lochmaben have appointed Mr. D. Balfour, C.E., senior partner of the firm of D. Balfour and Son, C.E., Newcastle-on-Tyne, as engineer for the new sewerage scheme for the burgh.

At a special meeting of the Failsforth Urban District Council Council on Monday a scheme for an extension of the sewage works was adopted, and it was decided to make application to the Local Government Board for power to borrow £11,390. The extension is in order to comply with the requirements of the Mersey and Irwell Committee and the order of the County Court.

Our Office Table.

THE Quantity Surveyors' Association has safely passed through the perils of inception, and was successfully inaugurated at a well-attended and animated meeting, held at the Holborn Restaurant on Wednesday afternoon. Mr. Hoffman Wood presided, and, while keeping members to the point, allowed the fullest discussion of all details, the meeting lasting over three-and-a-quarter hours. In the end it was decided, as will be seen by our detailed report in another column, not to restrict membership to the narrowest limits, but to welcome, at any rate for the present, all qualified quantity surveyors, whether they exclusively practise in that branch of the profession, or also act as architects. Indeed, had the line been more tightly drawn it was evident that few, if any, provincial practitioners would have been able to join. Such an association has a useful rôle to fulfil, and will inevitably raise the status of the profession by establishing a high standard of practice, and so gain for its members wider recognition from the public. It starts under excellent auspices with a membership of no less than a hundred and fifty, of whom two-thirds are in practice in the Metropolis, and it will speedily attract within its ranks all, or nearly all, the best men in the profession. We wish the movement all the success it deserves. Indeed, with Mr. Walter Lawrance as its first president, Messrs. Gate and Hoffman Wood (its originator) as vice-presidents, a small but strong committee, and Mr. F. B. Hollis, of 17, Bedford-row, as hon. secretary, its prospects for an increasing useful career are assured.

Among the applications to be made to Parliament next session is an important measure promoted by the London United Tramways Co., seeking powers to construct new lines of tramway from the High-street, Brentford, to Uxbridge-road, Ealing, another from East Bedford via Feltham to Staines, a third from Cranford along the Bath-road, Slough, and Taplow; a short line is sought to be made across new Kew Bridge, uniting the line to Kew Gardens and Richmond with the main systems of the company. The proposed lines will be laid in Brentford, Ealing, East Bedford-with-Hatton, Feltham, Stanwell, Ashford, Cranford, Harlington, Harmondsworth, Horton, Iver, Langley, Marish, Stoke Poges, Slough, Farnham Royal, Burnham, Hitcham, and Taplow. The same company is seeking powers to construct a tube railway from Hammersmith-station on the Metropolitan District system to Barnes.

THE Historical Records and Buildings Committee of the London County Council reported to that body on Tuesday that they had had under further consideration the question of indicating by means of memorial tablets houses of historical interest in London, and that they considered the following three houses worthy of commemoration—namely (1) No. 56, Devonshire-street, Portland-place, a residence of Sir J. Herschel, the astronomer; (2) No. 1, Devonshire-terrace, Portland-place, a residence of Charles Dickens; and (3) No. 12, Clarges-street, Piccadilly, a residence of Edmund Kean, the actor. They had carefully verified the facts connected with the houses in question, and had also in each case obtained the necessary consent of the ground landlords and the lessees to the erection of the memorial tablets. They accordingly recommend that the three tablets be immediately placed in position. The report was unanimously approved.

THE Housing of the Working Classes Committee of the London County Council reported at the same meeting that the housing manager had submitted to them a report of the work of his department during the year ended March 31 last. The report was satisfactory, since it showed that notwithstanding the continued increase in the rates, which now amounted to 19.46 per cent. of the outgoings, and the heavy income-tax for the year, the percentage of outgoings over the whole of the Council's dwellings was only 44.45, or 97 per cent. less than last year. The total loss by empties, including the rents lost at the opening of new dwellings, had amounted to 2.7 per cent. of the total rents receivable, and the rent written off as not recoverable amounted to only 2s. 11d. per cent. of the rent in charge, which was comparable with 10s. per cent. written off in 1901-2. The usual annual census of the Council's dwellings was taken in December, 1902, and showed that 9,480 rooms were occupied by 13,818 persons,

and the number of cases of overcrowding, which were immediately remedied, in most cases by transfer to larger tenements in the Council's dwellings, was only 15.

THOUGH not embodied in their report, published by us last week, p. 675, the treasury committee which has just reported on art matters in Scotland had under consideration the question of a site for the suggested new National Gallery. Inquiries were made as to the adaptability of the Royal High School buildings to the purposes of a National Gallery. These, it is believed, were satisfactory. The committee had before them the result of measurements made by Mr. Hippolyte J. Blane, R.S.A., of both the High School and the present National Gallery buildings at the Mound. It appears that the superficial floor space of the whole building at the Mound in which the National Gallery and the Royal Scottish Academy are housed, is 12,490ft., while the floor area of the Royal High School, with its central hall and gymnasium, amounts to 22,810super.ft., an increase of over 9,000ft. There are also at the Royal High School other buildings, which give an additional area of 2,346ft., which might be suitable for minor exhibitions, and there are possibilities of extension of the main building. The High School is a well-known Classical building, erected in 1829 from designs by Mr. Thomas Hamilton, and is now vested in the School Board.

MR. BATSFORD has just issued a second edition of Mr. J. Wright Clarke's book on "Pumps: their Principles and Construction," with 73 illustrations, redrawn for this edition, thus bringing it up to date for the use of masters, men, and students. Jack pumps, long barrel, and lift pumps, double and treble barrel pumps, water wheels, chain pumps, and bucket wheels are all dealt with, and a considerable variety of practical information is given which cannot fail to be useful, both at home and in the Colonies. The type is excellent, and the illustrations are drawn to a good size, well detailed. The price is 3s. 6d. net.

WITH the enterprise of the same publisher the same author has published a second series of "Lectures to Plumbers" (6s. net) delivered at the Polytechnic, Regent-street. The writer says his object is not to preach anything new, but to deal with details of everyday work, many of which he assures us are not thought of by most writers in plumbing, or are considered too small for notice. As a plumbing job is eminently one in which attention to detail is of the utmost consequence, no doubt Mr. Wright has done the right thing by insisting upon thoroughness in all parts of a plumber's work. He shows in a very graphic way how the old valve closets and D-trap condemned years ago, are still to be found in use contrary to all knowledge and sanitary experience, with their leaky, jointed soil-pipes and direct communication with the drinking-water supply cisterns. Having illustrated how not to do it, the lecturer shows how work ought to be done, not only with closets and baths, lavatories and sinks, but with all kinds of sockets and joints. He then deals with hydrostatics, and also with the construction of milk dairies and household laundries. Much trouble will be saved by following his advice.

THE new class of Forestry and Estate Management at the Royal Agricultural College, Cirencester, was inaugurated on Tuesday by an address delivered by Dr. W. Schlich, the newly-appointed professor. The Earl of Druce presided, and among those who took part in the proceedings was the Earl of Onslow, President of the Board of Agriculture. Dr. Schlich, in the course of his address, called attention to the growing dependence of this country upon imported timber. He adduced statistics to show that neither European countries nor the United States could be looked to for a continuous supply, as they were now exporting more than they grew, and although Canada, with proper management, might supply the needs of the world for an indefinite period, the peculiar conditions of the timber trade and the destructive forest fires precluded a too implicit reliance upon that source. He therefore strongly counselled an increase of home afforestation, and in the course of a detailed and elaborate calculation showed that, by selecting suitable species and soils, and with proper and systematic management, a return of 2½ per cent. could be obtained from forestry on land costing the following sums for planting: Oak £9 11s. per acre, beech £9 17s., Scottish pines £14 5s., sycamore £15 ls., silver fir £16 6s., ash £21, and larch £34 2s.

THE City Council of Manchester held special

meetings on Monday to obtain sanction to the promotion of three Bills in Parliament. The first is a Bill to confer on the corporation general powers for the needs of the waterworks undertaking, for the purchase of properties for street widening and improvement, for the confirmation by Parliament of arrangements between the Whitworth Institute and the corporation on the transfer of Whitworth Park to the corporation, and for the extension of the boundaries of the city, to include Withington, Droylesden, and probably Failsworth. The second Bill deals exclusively with the extension of the city tramways; and the third, which is promoted jointly by the corporation and the Ship Canal Company, to establish new financial arrangements between the corporation and the company.

CHIPS.

The St. Pancras Borough Council rescinded on Wednesday a decision come to by the previous council, and adopted by 36 votes against 20, a resolution giving statutory consent to the construction of a tramway connecting with the tramway in Hampstead-road and passing across Euston-road and along Tottenham Court-road to a point opposite the Horse Shoe Hotel. The sanction is given on the understanding that the London County Council will at once proceed to put in force the powers granted by the Council's Act of 1902, for the widening of Hampstead-road at the southern end, towards the net cost of which the borough council has agreed to contribute one-eighth.

A departmental committee appointed by the Home Secretary is now engaged in considering what amendments in the law relating to compensation for injuries to workmen are necessary or desirable, and to what classes of employment not now included in the Workmen's Compensation Acts those Acts can properly be extended, with or without modification.

The tramway system at Ipswich has been acquired by the Corporation, from a private company, and from plans by Professor Alexander W. B. Kennedy, and under the direction of Mr. E. Buckingham, borough surveyor, it has been converted from horse to electric traction, and extended in three directions—to the village of Whitton, to Bourne Bridge at the borough boundary in Stoke Hamlet, and along the Bramford-road. The Board of Trade inspection takes place to-day (Friday).

After a period of four years, owing to the late War, the competition of the stained-glass widows for the Dutch Reformed Church, Wimborg, Orange River Colony, S.A., has been shipped by Messrs. Swaine, Bourne, and Son, King Edward's-road, Birmingham.

A new wing which has been added to the Carlisle Institute, Meltham, by the founder (Mr. J. W. Carlisle), was opened on Friday by his son, Mr. W. W. Carlisle, M.P., for North Bucks. The institute was built and furnished twelve years ago at a cost of £6,000, and the necessity having arisen, the donor has had a new wing built at a cost of £2,500, exclusive of fittings, which he has also provided.

Mr. George C. Hailé, R.I., R.B.A., is about to hold an exhibition at The Modern Gallery, 175, Bond-street, W., of water-colour drawings under the title of "Venice: Colour and Sunlight." The private view is to-morrow (Saturday), and the exhibition will remain open until Christmas.

Mr. Everard Hambro has restored the little chapel of St. Catherine in the woods above his seat, Milton Abbey, Dorset. The chapel was, according to tradition, built by King Athelstan to mark his great victory at Brunanburh. It contains Saxon and Early Norman work, but since the Reformation the "chapel in the wood," as it is called, has been sadly desecrated, having been used in succession as a pigeon-house, a labourer's cottage, and a carpenter's workshop. The reopening is fixed for Wednesday next, the 25th inst, when Bishop Webb, Dean of Salisbury, will preach.

On Friday the new mission-hall, erected on Barking Tye, near Needham Market, for the Society of Friends, was opened. The hall is of red brick and cream plastered stucco wall, and covered with red Broom Hall interlocking tiles; the main room is 36ft. long by 18ft., and seats 120 persons; it has matchboarded dado and open roof. There is also a committee-room 18ft. by 9ft. The hall was built to the design of Mr. J. S. Corder, of Tower-street, Ipswich, by Mr. W. Death, of the West End Joinery Works, Ipswich.

An inquest has been held at Norwich-road relative to the death of Mr. John Downing, aged 74, of the firm of J. Downing and Sons, well-known builders and contractors, of Norwich, whose death took place under painfully sudden circumstances at his residence at City-road on Friday night. A verdict of death from natural causes was returned.

MEETINGS FOR THE ENSUING WEEK.

MONDAY.—Surveyors' Institution. "Industrial Decentralisation: an Important Factor in the Housing Problem," by Herbert T. Scoble. 8 p.m.

Society of Arts. "Mining of Non-Metallic Minerals," Cantor Lecture No. 1, by Bennett H. Brough. 8 p.m.

TUESDAY.—Institution of Civil Engineers. "Distribution of Annual Rainfall in British Isles," by Dr. Hugh R. Mill. 8 p.m.

WEDNESDAY.—Society of Arts. "The Universal Exposition at St. Louis, U.S.A.," by Geo. F. Parker. 8 p.m.

Auctioneers' Institute. "Particulars and Conditions of Sale," by W. F. Webster, M.A. 8 p.m.

THURSDAY.—Builders' Benevolent Institution. Annual Dinner, Whitehall Room, Hotel Metropole. 5.30 for 6 p.m.

Sheffield Society of Architects and Surveyors. "Notes on the Study of Architectural Design," by C. M. Haddfield, F.R.I.B.A. 8 p.m.

CHIPS.

The Chapel Schools, Cavalry Barracks, York, are being warmed and ventilated by means of Shorland's patent Manchester stoves, with descending smoke flues, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

Messrs. R. Waygood and Co., Ltd., of Falmouth-road, London, S.E., inform us that they have removed their Glasgow address to 116, Hope-street, the premises of the Liverpool and London Globe Insurance Co., where three of their electric passenger lifts have been fitted.

Messrs. Percy Bacon and Brothers, of 11, New-man-street, London, W., have just placed another of their windows in Bamburgh, Northumberland. The present specimen of their art consists of two emblematical figures and St. Cecilia.

The new Savoy Hotel extensions will be equipped with 19 "Otis" electric elevators. The installation comprises five powerful passenger elevators, four luggage elevators, and ten service elevators. All are electric, with "Otis" controllers, and, with the exception of two or three smaller short rise ones, the speed of the elevators will range from 250ft. to 300ft. per minute and upwards. Regard being had to speed and lifting capacity, the hotel, as a whole when complete, will have, counting the eight "Otis" hydraulic elevators in the existing hotel buildings, probably the largest hotel elevator installation in this country.

The Lord Lieutenant and the Countess of Dudley recently visited Rathmines, Dublin, on the occasion of the opening of the new houses for the working classes, which have been erected by the urban district council of the oldest township in Ireland. Mr. F. J. Hicks was the architect, and Mr. Good the contractor.

The arbitrators, Messrs. Woodhall and Stevenson, appointed by the Gas Co. and the urban district council of Nantwich, have nominated Sir George Bruce as umpire in the scheme for the purchase by arbitration of the gasworks.

In St. Catherine's chapel at the parish church of Berkhamstead, an altar and parclose screen have just been placed. They were designed by Mr. C. H. Rew, and carried out in oak by Messrs. Harry Hems and Sons, of Exeter.

It is proposed to provide a system of electric trams for the Bishop Auckland district, and application is to be made to Parliament this month for powers for the construction of lines from Bishop Auckland to Spennymoor, to Eldon-lane, to West Auckland, and to Etherley. Messrs. D. Balfour and Sons, of Newcastle, are the engineers for the undertaking.

Mr. F. L. Tulloch, representing the Local Government Board, has held an inquiry at Ombersley, concerning an application of the Droitwich Rural District Council for sanction to borrow £3,000 for sewerage works for the parish of Ombersley. The engineer is Mr. H. W. Taylor, C.E.

Mr. Hyman H. Collins, F.R.I.B.A., has been re-elected as an alderman for Paddington Borough Council, on which body he also serves as chairman of the public health committee.

A good business in London properties was carried out at the Tokenhouse Yard Mart last week, though limited to four days. One sale alone contributed £32,500 to the total, a freehold estate of 53 houses and shops, and one beerhouse situate in Copenhagen-street, and three contiguous roads, Barnsbury, N., the whole lot at ground-rents of £113 Gs. 8d., with reversions in six months to 2½ years to rack-rentals of about £1,500 per annum, being sold for £20,860. Another leasehold estate of 17 houses in Stoke Newington, with a rental value of £1,000 per annum, realised £8,650; and the Eldon House Building Estate of 3½ acres in Mitcham-road, Tooting Graveney, realised £5,000, equal to £1,500 per acre.

Trade News.

WAGES MOVEMENTS.

THE LABOUR MARKET IN OCTOBER.—The monthly memorandum prepared by the Labour Department of the Board of Trade is based on 3,673 returns—viz., 2,298 from employers or their associations, 1,302 from trade unions, and 73 from other sources. Apart from seasonal changes, employment on the whole is reported to have been much the same in October as in September. As compared with a year ago, employment generally is worse, and the percentage of unemployed members of trade unions continues to be higher than the mean percentage for the corresponding month in the past ten years. In the 226 trade unions, with an aggregate membership of 555,105, making returns, 32,358 (or 5·8 per cent.) were reported as unemployed at the end of October, as compared with the same percentage in September, and with 5·0 per cent. in 223 trade unions, with a membership of 518,412, from which returns were received for October, 1902. The mean percentage of unemployed returned at the end of October during the past decade was 4·4. Employment in the building trades is dull, and worse than a month and a year ago. The percentage of unemployed trade union members among carpenters and joiners was 5·6 at the end of October, compared with 4·0 at the end of September, and 4·0 a year ago. The percentage for plumbers was 6·6 at the end of October, compared with 6·4 at the end of September, and 5·8 a year ago. In the furnishing and woodworking trades employment has generally declined during the month, and is worse than a year ago. The percentage of unemployed trade union members at the end of October was 5·2, as compared with 4·7 in September, and 4·3 in October, 1902. The total number of workpeople involved in disputes which began or were in progress during October, 1903, was 10,747, compared with 11,577 in September, 1903, and 24,151 in October, 1902. Definite results were reported during the month in the case of 21 disputes, new and old, affecting 5,068 workpeople. Of these disputes, six, involving 2,936 persons, were decided in favour of the workpeople; 12, involving 1,908 persons, in favour of the employers; and three, involving 194, were compromised. The changes in rates of wages reported during October affected about 12,000 workpeople, of whom about 900 received advances and 11,100 sustained decreases. The net effect of all the changes was a decrease of about £200 per week.

DUNDEE.—The Dundee Advertiser calls attention to the unfortunate condition of the local building trade. It has been found, it states, that the number of unemployed workmen is much larger than has been known for many years. The operatives chiefly involved are masons, joiners, and labourers, but others, such as plasterers, plumbers, painters, glaziers, and heating engineers are also feeling the pinch. Within recent months hundreds of young workmen, unable to find scope for their energies at home, have sought the wider fields offered by the colonies. Indeed, the departure of the emigrant train on Friday evenings has come to be numbered among the events of the week. The cause of this extraordinary depression is difficult to ascertain, but tenement property has been over-built, and no structures of a public character are meantime in course of erection. Within recent years a feature of the trade has been the steady and increasing tendency of those occupying central flats to move towards the suburbs. Tenements have thus suffered depreciation in value. From the strictly industrial point of view, the movement has advantages, inasmuch as it will lend an impetus to the erection of self-contained dwellings. The result of this shifting has been a corresponding movement of weekly tenants into better-class properties. This, in turn, has involved the desertion of the older and less salubrious localities, in the heart of which hundreds of one-roomed houses are vacant.

The Carnegie free library at Grays was opened by the Countess of Warwick on Friday. It has cost £3,000.

At a meeting of the Governors of the Glasgow and West of Scotland Technical College on Monday, Mr. Copland, who presided, stated that the building fund of the college amounted to £183,414. Good progress was being made in the building, and the contractors were being paid at the rate of about £1,500 a week.

On All Saints' Day the outlying church of All Saints, Shorthampton, Oxfordshire, was reopened. The building was falling into decay, but has now been restored at the cost of Mr. Vernon J. Watney, of Cornbury Park. During the work of restoration several wall-paintings dating from the 13th, 14th, and 15th centuries have been uncovered, and a remarkable bagioscope reopened. The architect was Mr. John Belcher, A.R.A., and Mr. Philip M. Johnston unveiled the mural paintings.

LIST OF COMPETITIONS OPEN.

Sunderland—Additions to Town Hall	£100, £50, £25	John W. Moncur, A.M.I.C.E., Borough Engineer, Sunderland	Nov. 21
Bray—Pavilion and Winter Gardens	£30, £15, £10, and three of £5 5s	Frank Bethell, Hon. Sec., Town Hall, Bray	30
Wakefield—Reconstructing Cattle Market	50gs. (merged), 25gs.	R. Ernest Langborne, Solicitor, Wakefield	Dec. 1
Elgin—School (340 places)	Hugh Stewart, Clerk, Elgin	7
Selly Oak—Public Baths (Assessor)	A. W. Cross, A.M.I.C.E., 23, Valentine-road, King's Heath	7
Clare, Suffolk—Water Supply Scheme (population 1,582)	J. Bigmore, Clerk, 24, Queen-street, Haverhill, Suffolk	10
Herne Hill, S.E.—Public Library	H. J. Smith, Clerk, Lambeth Town Hall, Kennington Green, S.E.	16
Aylesford—Single-Span Stone Bridge over Medway (Assessor)	100gs.	The Town Clerk, Maidstone	Jan. 1
Windsor—Elevations for Police and Fire Brigade Stations	25gs.	E. A. Stickland, A.M.I.C.E., Borough Surveyor, Windsor	15
Erdington—Council House and Free Library (Wm Henman, F.R.I.B.A., Assessor)	£50, £30, £20	Herbert H. Humphries, Eng., Public Hall, Erdington, Birmingham	Feb. 1
Vienna—Machinery to Lift Boats	100,000, 75,000, and 50,000 kronen	The Austro-Hungarian Co.-Gen., 22, Laurence-Pounteney-lane, E.C. Mar. 31	
Fraserburgh—Infectious Diseases Hospital and Public Library	William Alexander, Burgh Surveyor, Fraserburgh	—
Rhyl—Pavilion (10,000 places) at National Eisteddfod	H. A. Tilly and J. W. Jones, Gen. Secs., Town Hall, Rhyl	—

LIST OF TENDERS OPEN.

BUILDINGS.

Hindley—Disinfectant House	Urban District Council	A. Holden, A.M.I.C.E., Surveyor, Hindley, Lancs	Nov. 21
Manchester—Stables and Messroom	Corporation	The City Architect, Town Hall, Manchester	21
Wargrave—Cottage and Engine House	Wokingham R.D.C.	W. G. A. Hambling, Architect, Queen's-road, Reading	23
Keighley—Alterations at Eastwood Schools	School Board	Wilson Bailey, Architect, Tanfield Buildings, Market-st., Bradford	23
Swansea—Rebuilding Rum Puncheon Inn	Wm. Williams	Henry C. Portsmouth, Architect, 6, Fisher-street, Swansea	23
Elgin—Villa, Porteaith-avenue	R. B. Pratt, Architect, Town and County Bank Buildings, Elgin	23
Sheffield—Saleshops and Artisans' Dwellings, Soig Hill	Surplus Lands Committee	Gibbs and Flockton, Architects, 15, St. James's-row, Sheffield	23
Perth—Extension of Intermediate School	Glamorgan County Council	T. Mansel Franklin, Clerk, Westgate-street, Cardiff	23
Rochester—Alterations to Centre Tower of Cathedral	Guardians	C. H. Fowler, F.S.A., Architect, The College, Durham	23
Droxford—Repairs to Master's Office at Workhouse	Education Committee	Francis Clark, Clerk, Bishop's Waltham, Hants	23
Tottenham, N.—Altering Lancasterian Schools, Church-road	Co-operative Society	G. E. T. Laurence, Architect, 22, Buckingham-street, Adelphi, W.C.	23
Penwithick—Sunday School	William J. Jenkins, Architect, Bodmin	24
Consett—Eight Houses, Garden-street and Clarendon-street	E. Huntley, Secretary, Newmarket-street, Consett	24
Aranmore—Coastguard Station	The Office of Public Works, Dublin	24
Sunderland—Wheat Sheaf Tramway Offices	Borough Council	F. E. Coates, A.R.I.B.A., 41, Fawcett-street, Sunderland	24
Fulham, S.W.—Terracotta Bandstand in South Park	H.M. Commissioners of Works	F. Wood, A.M.I.C.E., Boro' Engineer, Town Hall, Fulham, S.W.	25
Bootle, Liverpool—Post Office	The Secretary, H.M. Office of Works, Storey's Gate, S.W.	25
Alnwick—House, Swansfield Park-road	Urban District Council	M. Temple Wilson, M.S.I., Architect, Alnwick	25
Finchley—Cottage, &c., Long-lane	Borough Council	The Engineer, Council Offices, Finchley, N.	25
Fulham, S.W.—Iron Bandstand in South Park	Merthyr Tydfil School Board	F. Wood, A.M.I.C.E., Boro' Engineer, Town Hall, Fulham, S.W.	25
Merthyr—School (250 infants) at Edwardsville	J. Llewellyn Smith, Architect, Aberdare	26
Pengam—Two Business Premises	Corporation	J. Davies, Coal Hole Inn, Gellihaif, Maesycwmmwr	26
Eastbourne—Fire Station, Grove-road	Town Council	P. A. Robson, A.R.I.B.A., Palace Chambers, 9, Bridge-street, S.W.	26
Evesham—Sulphate Plant Building	Electric Committee	P. H. Fletcher, Engineer, Gasworks, Evesham	26
Merthyr—Rebuilding 59, High-street	Urban District Council	C. M. Davies, 112, High-street, Merthyr Tydfil	26
Kilmarnock—Generating Station	Sanitary Committee	Robert Blackwood, Burgh Surveyor, Market Bridge, Kilmarnock	27
Waltham Abbey—Public Buildings	Guardians	W. T. Streather, Surveyor, High Bridge-st., Waltham Abbey, Essex	27
Lichfield—Taking down Houses, Upper St. John's-street	Urban District Council	Emerson Brooke, City Surveyor, Stowe-street Depot, Lichfield	27
Nottingham—Plant House at Workhouse	Urban District Council	G. Muncester Howard, Clerk, Bagthorpe, Nottingham	27
Knarborough—Purifier House	Borough Council	J. E. Walker, Surveyor, Town Hall, Knarborough	28
Dodworth—Brick Culvert	George Strutt, Surveyor, High-street, Dodworth	28

FRIDAY, NOVEMBER 27, 1903.

ARCHITECTURAL PRACTICE.

THERE is a prevailing idea that the architect's work is practically done when the contract drawings are finished, that after that period he can retire and watch his design being carried out. The period of architectural conception and incubation is no doubt the most important and vital—all the possibilities of the scheme are foreshadowed; but it is all anticipatory: the realisation may prove far from equal to it; indeed, it may be even a failure. The rough sketch of the painter on canvas is not the picture itself, though it may fairly be taken to be some guarantee of the real performance, for the same hands will carry out the composition, and the same scheme of colour can be followed. And the same with the sculptor's model; it is the work of the artist himself, who wishes to express in clay the lineaments and to suggest the form his finished work in marble is to take. In both these instances the design and execution are the work of one person. It was always so in the art of the past. In stone and wood carving this fundamental condition helped to produce the unity and vigour of the real work we are so fond of reproducing. The two functions are now quite separated; the architect or designer has his own office, or studio it may be, miles away from the actual building that is being carried out. He conceives an able design, full of invention and individual power; but so long as it remains on paper there is no reality about it; the drawings, in fact, may be and generally are made by an artistic draughtsman who knows very little about the materials and workmanship necessary to carry it into execution; the architect sends it out as his own. The transaction is a business one complete in itself; but it stops short of the real thing. It is made a matter of payment at so much on the estimated cost, or the designs are prepared for a premium, as in competition. The client bargains with the architect to prepare a design to include everything for so much—this is one transaction; and the latter enters into another bargain with the builder to carry it out at often the lowest rate—this is another and different transaction. There is no connection between the architect and builder, who may be as far as opposite Poles out of sympathy with each other. For, as one writer who speaks of the false position of both parties observes in regard to carving: "When one makes a 'design,' and another carries it out, the 'designer' sets his head to work (we must not count his hands, as they only note down results in a kind of writing), a design is produced, and handed over to the carver to execute. He, the carver, sets his hands and eyes to work to carry out the other man's idea, or, at least, interpret his notes for the same, his head, meanwhile, having very little to do further than transfer the said notes to his hands. For very good reasons, such an arrangement as this is bound to come to grief. One is that no piece of carving can properly be said to be 'designed' until it is finished to the last stroke. A drawing is only a map of its general outline, with, perhaps, contours approximately indicated by shading." The observation is equally true with regard to the relation between the designer of a building and the contractor. Even if the architect furnished a full-size model to the builder, he ought to be able to modify his design at every step of the progress of the actual building, to alter

his intention as the work develops under his hand. But in the modern sense of these vocations each is regarded as finished or complete in itself. So it is the architect's work at the present day is that of making "designs" for buildings. Whether these are really carried out in the true and honest meaning is not essential, as it ought to be.

To try and find means of bringing the two parts of the one art together again, to unify the efforts of designer and builder or craftsman, that they may again co-operate, is the chief object we ought to have in view. So long as the architectural profession are content to remain as they are, so-called designers of buildings, their work amounting only to architectural draughtsmanship and routine, they are perfectly independent of the actual result, and have not realised the full meaning of their art. In the practice of modern architecture it is obvious to all that the two branches of the profession to which we have referred are not actuated by a single aim. The two parts are not identical. Designs are made for buildings to satisfy a client or a committee, quite apart from any consideration of fitness or artistic merit. A client wants to build a villa that will be up to date and moderate, or a committee to select a design for a building that will be attractive, or that will enable them to obtain funds. Consideration of adaptability or cost scarcely enters into their minds, and the architect prepares a design without reference to the actual conditions. He makes it as a speculation as attractive as he can, as a finished set of drawings that can be treated or used as a design for a building, whether built or not. Its one aim is to be a representation, a kind of showcard. While the designer's aim is to make it attractive, the builder's aim is to build it at the least cost. The two ideals are not the same; one appeals to the senses as reached through the eye, by lines and perspectives and shading, the other to the practical requirements of the occupants, to the real sensible qualities of building materials, to the sense of convenience and comfort. In the plan, it is true, the architect touches more directly the real design of the building, as plan appeals most to the actual wants of those who use the building. A good plan, accompanied by an outline elevation or two defining the proportions and main features intended, may actually convey the architect's meaning more truly than an elaborately tinted and shaded elevation, which cannot be executed to produce the same effect. Those who have the largest experience in building will agree that a set of highly-finished drawings are very delusive, as they do not actually represent facts, materials, and real details. These generally evolve themselves during the execution of the work; the original intention is modified, and the details are changed and developed under this architect's hand as the work proceeds. Finished draughtsmanship may be excellent in conveying the appearance and details of old buildings to the eye—in this case it is representative of work actually executed—but to indicate the intention of a designer of a new building by a finished drawing is to forestall the real design. It either exceeds the realisation, or does not do justice to it, the exceedingly fidgety and dotty drawing exaggerates immensely the effect of the design; thus the "liney" drawings we often see make a comparative quiet and simple design look fussy, and seldom represent the real details, as they abound in unnecessary lines. When we speak of the architect's design for a building, we mean the actual work. This is the only true sense in which it can be intended; but nowadays his "design" means the conception on paper of a drawing. In this sense draughtsmanship has grown to be an art of itself, and the more finished the

drawing the more the public appreciate the work. The more elaborate and costly it the better. But when we come to consider architectural practice from the point of view of the builder, all is changed; the detail and ornament must be cut down, the amount of tender must not exceed a certain cost, the arrangement must be equal to the demand made, the sanitary construction must be perfect, the heating and ventilation adequate, the rooms planned with particular reference to all those who occupy the building, the materials and construction above reproach; matters which very considerably modify the design as represented by the draughtsman. And it is this practical side of the picture which has so little to captivate the designer and the client; it is the translation of design into matter-of-fact business. Those who make a good business as architects prefer the former side of the work; there is no trouble in negotiation, the labour in preparing sets of plans and elevations after the design has been agreed to is light compared with the responsibilities of carrying out the design, the periodical supervision of the building, and the trouble inseparable from having to do with an evasive and litigious contractor who is constantly on the alert in taking advantage of details of construction, in evading specification provisions, and in putting inferior material and workmanship into the building. When the profession begin to realise the twofold character of their calling, that the design of buildings is not completed when the contract drawings are finished, that they are only instruments in the architect's hands to effectually carry out his intentions, they will have a more satisfactory view of their art, and their work will be more thorough and honest. For the purpose of enforcing their remuneration and their claim to their drawings, architects avail themselves of this argument: that drawings are their tools, and have no other value; yet it is strange that if this is so, so much value should be attached to the design apart from the supervision of their work. Architecture will be more honest when the profession return, so far as they can, to the ancient idea that design and craftsmanship are one, and must go hand-in-hand, that they were never separated as they are now. To try and unite the two branches is the one way, and this must be attained by reconciling the designing with the supervision of buildings. The architect can at least endeavour to make his drawings more practical, even if by so doing he sacrifices something of draughtsmanship and finish; he must bring them into line with actual facts, not put more lines in his elevation than is really necessary to indicate detail. He must look at the execution of his design as its natural complement. They should be treated as one. When drawings are made to explain a design, to suggest a method of construction, they are valuable aids; but very often they are puzzling and enigmatical to the workman: they show eccentric and wasteful modes of work, they are arbitrary instead of being explanatory. The consequence is the builder rebels, or does the work in another or less troublesome way. Supervision of buildings is distinctly a part of the work of the architect, though it is generally regarded as a subordinate duty which can be intrusted to anyone who is practical. In the designing or office part of the architect's duty, every effort is made to attract the client, and to show a building that would, if properly executed, cost much more than is intended to be spent; but when we come to the executive function we find other counsels prevail. The system of selecting the lowest tender is a strong temptation to the builder to resort to cutting prices, which means, of course, a lowering of the standard specified. Advantage will be taken by the contractor of a certain class to secure "extras" or to evade the clear provisions of the specification. The hard bargaining, cutting and contriving, and

giving and taking very seriously contradict the architect's former work; the design is whittled down in substance, details are simplified, ornament omitted, often with advantage, but the building suffers in the long run. It is certainly the architect's duty to prevent these opposite influences as far as he can. Of course, the primary step is to study economy and simplicity in design so as to avoid the necessity of low tendering. But he can also do a good deal in the progress of the work in co-operating with the builder and the workmen, in agreeing upon methods of workmanship and material, in visiting the workshops, and in the selection of goods from different tradesmen. The various ways by which the architect and builder may co-operate in the design are rather obscured by the present system of contracting, which fixes upon certain quantities. Under the old plan, when the builder was employed to carry out the design upon the measure and value system, it was possible to make improvements and modifications during the progress of the work. The architect could, if he saw an improvement, alter his plan or his detail without inconvenience to the builder. But modern conditions, tendering, contracting, and machine labour, have all combined to make the architect's connection with the building operations less close. And for these reasons it is important to consider how far the constructive part of the profession can be brought into closer relationship with the design. A more thorough knowledge of construction and the processes of building is of course essential. We are beginning to realise the value of technological training; but at present such instruction is confined to students engaged in the practical work of building, to craftsmen especially. This no doubt is a great gain, the trades connected with building are often incapable of grasping the principles of design, they are often deficient, as the examiners of the Board of Education have said, in elementary knowledge of physical science and drawing, and of expressing their ideas with precision. When they have mastered these elements, we may look forward to a more intelligent appreciation of the architectural reasons of design than they now possess, and they will be able to approach nearer to the standard required by the profession. But this training is perhaps beginning at the wrong end. We want levelling-up on both sides. The architectural student is at present very much in the hands of those in our schools who are attempting to impart practical knowledge by precept and example, without reaching down far enough to the technical methods of the workman. The class and office instruction have been mainly confined to drawing and historical details of building; and between the architect and the workman there is still a gulf to be bridged. We cannot lose sight of the indifference of the younger professional man to the methods of work of the building trades. He places a scheme or design in their hands, which to them appears arbitrary, and he expects it to be carried out. Therefore we think a more thorough educational system ought to begin at both ends. The architect and designer must be able to show those who carry out his designs that he understands their materials, difficulties, and limitations; that his ideas are reasonable and practicable, and upon these conditions he is more likely to influence them.

MUNICIPAL HOUSING SCHEMES.

WHEREVER we go in London we observe how rapid has been the progress in new building schemes and the housing of the working classes. Demolition of a large area is quickly followed by the erection of large and often palatial-looking blocks of dwellings in process of construction, or completed and occupied. The borough councils have

lost no time in setting this problem before them and in carrying out the provisions of Part II. of the Housing of the Working Classes Act, 1890. This Act, as our readers know, empowers local authorities to prepare and execute schemes for the improvement of areas too small to be of general importance to the county and in conjunction with the London County Council or otherwise. This part of the Act deals with all dwelling-houses unfit for human habitation, or obstructive buildings, and for converting an insanitary area too small to be dealt with under Part I., so that the enactment has a wide application in London and other populous towns. Large insanitary areas only are dealt with under Part I., or those which the medical officer thinks are of importance to the County of London as a whole. Early in the present month the Borough Council of Bermondsey laid the foundation-stone of four blocks of model dwellings which will house nearly a thousand persons, and this scheme may be taken as an example of many others that have been carried out during the last few years. From the site of the Bermondsey dwellings unhealthy slums have been removed which housed not more than half the number of tenants. This is a good example of municipal enterprise which deserves to be followed.

Referring to the work of Mr. C. J. Stewart on "The Housing Question in London," the scheme is known as the "Fulford-street and Braddon-street Rotherhithe Improvement Scheme, 1897." The area is about two acres in extent, and consisted of properties inclosed by Rotherhithe-street, Seven Step-alley, Paradise-street, and houses in Love-lane and Iron-yard, and included 100 houses, composed mainly of houses backing on narrow courts and alleys, and in a very defective condition. The scheme originally provided for the erection of dwellings for 550 persons in lieu of the 736 persons displaced, and for the widening of the main streets. The area is rectangular in shape. In 1898 the vestry submitted plans for the dwellings to be erected on the cleared site, showing accommodation for 890 persons in 110 tenements of three rooms, 30 tenements of two rooms, and 55 single-room tenements. The estimated net cost of clearance was £29,120, the London County Council contributing half that sum. We may here briefly describe the design. The Bermondsey Borough Council advertised for competitive designs; and Messrs. Brocklesby, Marchmont, and East, were placed first by Mr. John Slater, vice-president of the R.I.B.A. We understand the four blocks will be all completed in March of 1905. Two blocks are parallel, and separated by a 40ft. yard between them in the rear, and this yard will be paved, and inclosed from the end streets by iron railings and gates. The second couple of blocks will face each other, separated by an area of 52ft. wide to be laid out as a garden, with paved paths, kept away from the ground-floor of each block. It will be reserved for the private use of the tenants of the four blocks of dwellings. In the design of these buildings, the architects have adopted the balcony system instead of the internal staircase, which has been so generally used in the London dwellings. The internal staircase has its drawbacks; it forms an undesirable rendezvous for tenants and children, a dark and draughty means of access, and encroaches upon the squareness of the plan. The balcony system is less costly, and gives more convenient access to the tenements; it allows better planning and grouping of the w.c.'s and sculleries, and insures ventilation. The buildings as planned give 25 one-room tenements, 165 two-room, and 45 three-room tenements. The dimensions are stated as follows:—Minimum width of living-rooms, 10ft. 6in., giving an area of 144super.ft. in the clear. Each bedroom has an area of 96ft. super. net, with a minimum width of

7ft. 6in. Some of the bedrooms will be entered direct from the lobby—a very desirable point. Solid and durable materials are to be used, and fire-resisting construction is provided. Externally the fronts will be faced with yellow stocks, with red brick dressings, and glazed bricks will be used in the staircases and balconies. The work is being done by direct labour, Messrs. Walter Lawrance and Son, Waltham Cross, being the contractors, and Mr. F. S. Smith, the clerk of works. From the elevations the design has something in common with other recent municipal buildings we have seen, being plainly treated with slight projections gabled, with a curb roof, and with dormer windows in the roof; the angle quoins will be of red brick, and the basement story of a darker material than the upper stories, there being four stories under the eaves and one story in the roof. The broken gables and curb roof of tile with the plain chimney stacks which rise above the roof impart a little variety to the block. The windows are quite plain, with square sash-frames and flat segmental arches, and the plainness of the brick style and fenestration and high roof give a substantial 18th-century character to the design.

The lately-built blocks of dwellings on the Millbank Estate is another instance of housing of a modern type. The blocks of substantial red brick with their tiled curb roofs and dormers and gabled ends, resemble in their main characteristics the Bermondsey scheme. In the Millbank Estate the blocks have been arranged on the area in quite a symmetrical form. It has two advanced plots of trapezoidal shape towards Dundonald-street, separated by a narrow garden plot in the centre about 300ft. in frontage towards that street. Beyond the garden behind, two plots of similar shape divided by a road in centre which forms the axis, are covered with blocks known as the "Turner" and "Ruskin" buildings, and still further back from Embankment is Erasmus-street, parallel with Dundonald-street, and having in its centre another block with advancing wings known as the "Hogarth" buildings, surrounded by land of the School Board. These are also flanked by other detached blocks named the "Gainsborough" and "Reynolds" buildings. These blocks have now been all completed and occupied, we believe. They have, as shown, been named after British artists, and, we believe, have been designed chiefly by the architects of the Council. They vary in plan and accommodation. "Hogarth" buildings were the first to be built, and provided rooms for 306 persons. They were completed in 1899. They contain 54 tenements, of which one is of five rooms, 10 of four rooms, 22 of three rooms, and 21 of two rooms. Twenty-four tenements are self-contained, except that the private w.c. of each is detached. The rents range from 7s. to 13s. per week, according to size of tenement. The Leighton and Millais buildings accommodate 240 persons in 50 tenements, of which 30 contain three rooms, and 20 two rooms; two of the tenements in each block are self-contained, and 15 of the same class have the private closets detached. These buildings have an obtuse-angle frontage; a large polygonal projection occupies the angle, and contains on each floor a living room and bedroom, and at the back the triangular-shaped corner is taken up by the staircase. The corner has on each side a small scullery and bedroom or living room in front, in addition to those in the polygonal corner, making two-roomed tenements.

Liverpool, among other large towns, has expended large sums in dwellings of an improved character. The largest scheme yet attempted by the corporation has just been commenced to supplant 511 insanitary houses in the neighbourhood of Hornby-street in that city. The new buildings will accommo-

date, it is stated, 2,446 persons at a cost of £150,000. The site was purchased by the corporation under the Act of 1890, as an "unhealthy area." In addition, several insanitary houses are to be removed. The whole accommodated 2,431 persons, which, according to the Act, had to be provided for. The design comprises 23 blocks or 445 dwellings. These are arranged as follows: 48 four-roomed dwellings, 270 three-roomed dwellings, 90 two-roomed dwellings, and 36 one-roomed dwellings, seven shops, and recreation ground. The dwellings are to be set back from the present line of street, making a width in front of 70ft. Each dwelling has its own separate sanitary provision. The blocks are of three stories. The living-room has a superficial area of 150ft., the principal bedroom 125 super. feet, and second bedroom 100ft., and the third bedroom 80 to 90 superficial feet. The average height of rooms is 9ft. Local grey bricks and red brick dressings have been used; the entrances are of buff terracotta. The staircases are lined with glazed roofs, the floors are constructed of small iron joists with coke-breeze concrete, on which the boards are nailed. The roofs are of slate. The ashes are discharged into bins by means of shoots at the back. The contractors for the first portion of these buildings are Messrs. Joshua Henshaw and Sons, and the amount of contract is £23,382. It is stated that 71 per cent. of the tenants displaced have availed themselves of the accommodation provided in the immediate neighbourhood. When the new dwellings on the demolished area are completed another portion will be cleared, and the dispossessed tenants will occupy the new houses; in this manner the scheme is proposed to be carried out in three portions. The one-room tenements are to be let at 2s. per week, the two-room tenements at 3s., the three-room at 4s., and the four-room tenements at 5s. The scheme will return 3 per cent. net at the above rates. Next in point of size to this scheme is the Victoria-square dwellings, which were built for a different class of tenants, and comprise 270 dwellings with 13 shops. These are a few instances of the schemes set on foot by large municipalities. Others may be mentioned, as those erected in Manchester, Birmingham, Glasgow, and other large centres of industry. They are indications of what may be done under the Housing of the Working Classes Act, 1890, and by means of instalments, or the gradual clearance of unhealthy areas and houses on a small scale, and the rebuilding of dwellings of an associated or self-contained class. In these recent developments of the housing problem, it will be seen the aim has been to provide tenements for each of several classes of tenants, instead of for one class. The two-roomed and three-roomed tenements are those most in demand in our great town centres, though the single-room tenement must not be forgotten, and a small percentage of shops and a recreation-ground appear also to be of value in any large scheme of rehousing.

THE ARCHITECTURAL ASSOCIATION.

THE fourth meeting for the present session of the Architectural Association was held on Friday evening at 9, Conduit-street, W., Mr. R. S. Balfour, Vice-President, in the chair. The following new members were elected:—Messrs. H. S. Stowell, J. A. Wilson, F. S. Chesterton, C. N. Lucass, G. Hubbard, R. H. Browne, Lucio Velasco, H. de A. Brown-Morrison, F. A. Col-lard, S. Murray, S. L. Stearne, and Sir G. Rayner. The chairman mentioned that at the meeting of the Discussion Section to be held on Wednesday, Dec. 2, a paper on "Theatres" would be read by Mr. H. T. B. Spencer. He also announced the following additional donations to the New Premises Fund:—Mr. H. Saxon Snell, £52 10s.; Mr. Edwin C. Pinks, £15 15s.; Mr. A. O. Col-lard, £12 12s.; Mr. W. D. Caroe (second donation), £10 10s.; the Proprietors of the *Builder*, £10 10s.; Mr. W. Talbot Brown, £5 5s.; Mr.

R. H. Butterworth, £5 5s.; Messrs. Lander, Bedells, and Crompton, £5 5s.; Mr. C. E. Varn-dell, £5 5s.; Mr. W. C. Waymouth, £5 5s.; Mr. Edmund Woodthorpe, £5 5s.; Mr. G. Cor-deroy, £5; Mr. A. H. Kersey, £3 3s.; Mr. J. E. Capell, £2 2s.; Mr. W. Dewes, £2 2s.; Mr. R. A. V. Harrison, £2 2s.; Mr. W. Stewart (second donation), £2 2s.; Mr. Arthur Stratton, £2 2s.; Mr. H. Topley, £2 2s.; Mr. F. A. Coles, £1 1s.; Mr. L. G. Detmar, £1 1s.; Mr. A. W. Field, £1 1s.; Mr. A. J. Hopkins, £1 1s.; Mr. Ernest Newton, £1 1s.; Mr. T. M. Smith, £1 1s.; Mr. C. F. A. Voysey, £1 1s.; Mr. R. H. Dods, 10s. 6d.; Mr. D. B. Hart, 10s. 6d.; Mr. L. Morgan, 10s. 6d.; and Mr. T. Campbell Pope, 10s. 6d. The chairman added that 162 members had generously doubled the ordinary subscription for the year, in accordance with the suggestion thrown out by the committee, the donations thus accruing amounting to £116.

FARM BUILDINGS.

A paper on this subject, illustrated by plans and sections, was read by Mr. H. M. CAUTLEY. The lecturer explained that he should speak wholly from within his practical experience, gathered on farms and amongst farmers in the Eastern Counties, and should restrict himself to the description of that type of buildings and fittings in which the truest economies were effected, and thus made most suitable to meet the requirements of those to whom farming was a real business. As to the site and position of the buildings, the first essential, he continued, is a good water-supply for both house and yards. This necessity was provided for by our ancestors by grouping all the buildings about some good pond, and though no doubt picturesque, in these days of windmill power and hydraulic rams, some further reasons must be adduced for planning the buildings about visible water. The next most important point is to get the building quite close to some hard metalled road maintained at the public expense. A farmer's private roads in and about his holding are a perennial source of expense to him. As to the position of the buildings on the holding, in an arable one they should be as near the centre as possible, unless on the slope of a hill, when it should be nearer the top to save the uphill carting of manure. In dairy farms, however, the buildings should be near the centre of the pasturage part of the holding, so as to avoid fetching and feeding the cows from long distances. And further good points one might look to find in an ideal home-stead would be a dry, healthy soil, easy drainage, and a sheltered southern slope. The best aspect for stock is no doubt south with a touch of east in it; but when building on a slope, unless the aspect is utterly wrong, the building should perhaps be placed across the direction of the slope, or some very awkward steps will have to be dealt with. Finally, in rebuilding old home-steads—and in England most of our work must be with such—do not accept it as an axiom that they should be rebuilt on the old site. Some of the foregoing advantages should be looked for on the holding, and if found in greater measure at some other point, rebuild your homestead there. Do not be afraid of leaving one or two buildings too good to be pulled down isolated; they will prove useful for a variety of objects. And now, having to erect a new homestead, what should be its arrangement and construction? It should be built with an eye to careful economy of construction and maintenance, in the most labour-saving and convenient manner possible; but, above all, it should provide for the most suitable and sanitary housing of livestock. I have never seen any group of buildings for a mixed farm even when I have visited so-called "model" buildings, which were not teeming with defects. I have not come with any perfect plan, but I believe that it will be found somewhere between the two extremes, presented by the old-fashioned and modern or "model" homesteads.

HOMESTEADS: ANCIENT AND MODERN.

But perhaps it would be most helpful to glance at the advantages and disadvantages of both. In an old homestead there will generally be a large rambling old barn of flail-threshing memory, with perhaps the cowsheds ranged about same; then the stables will be in an entirely separate block, the piggeries in another, the granary, chaff-cutting house, and cartshed in another, and various outlying loose boxes and small cowsheds wherever there is an odd corner. In addition to this, the yards are nearly always of a much too large a size, rain-washed and wasteful of litter,

all tending to the making of bad manure, whilst apparently the aspect was rarely studied at all. This is obviously not of a labour-saving character, or suitable to the modern practice of farming. But to turn to the modernised type, which common usage designates as "model." Here all the buildings, even down to the fowl-house, are grouped in one large parallelogram, the outside walls of which arise square and gaunt, with scarcely an opening to be seen. I am not urging its ugliness, though I believe it to be the outcome of one of its most practical defects, namely, that everything is approached from within, frequently from internal roads and alleyways. Were it situated on some of our blackest wold lands I should find excuse in the pitiless winds and rains which drive across them; but why when on some sheltered hillside or sunny valley? It does not save roadways, the sparse openings are distributed on all sides, and they must have approaches, so the system is even wasteful of cart-way. I cannot believe, either, that the buildings so grouped can be as healthy and sanitary as those built in more open formation. The internal alley-ways also make independent walls just as necessary as they are in more open formation, so there is no economy effected in construction. In case of fire, too, the whole range of buildings is endangered, and unless the removal of the stock was undertaken early in the conflagration many must inevitably be lost.

IN DESIGNING A COMPLETE HOMESTEAD

myself I should certainly have as few internal approaches as possible, but everything, as far as possible, approached from a common farm road-way, and whilst grouping the cowsheds, stock-yards, and piggeries under the shelter of the barn, granary, &c., keep the horse yards, stables, and cartsheds distinct. The staffs that work these two departments are entirely distinct, and if over the cartsheds a roomy loft was constructed, into which a stack could be threshed direct, the extra labour involved is nothing. But I will proceed to the

PRACTICAL DETAILS

in connection with the various buildings. All repairs should be capable of being undertaken by the estate carpenter, or else whatever is broken or missing is sure to be neglected till some serious mishap arises through it. For this reason, and for the reason that on most estates enough timber is felled and steam-sawn sufficient for the purpose of repairs, I am strongly in favour of the simplest wood construction in everything but the main fabric.

STABLES.

In cart-horse stables, it is very desirable that each horse should be provided with a separate division, which must in no case be less than 6ft. wide. In old-fashioned stables it was not at all unusual to find all the horses standing together with no divisions between, but this is much to be regretted. When farmers shrink from what they consider extravagance, perhaps, the best compromise is to divide up for pairs, the divisions with 10ft. centres, and the weak horses can then be put together. The width of stable may be arrived at by allowing 2ft. for manger, 7ft. for standing, 12in. for gutter, and 5ft. for passage-way behind. The cubical contents necessary, 800ft. per animal, applies to both stables and cowsheds. No general rule for determining the number of horses required to be provided for can be given. Roughly speaking, a horse to every 25 acres is what is generally needed. The manger should be of 1½in. plank, and about 3ft. high, with stout, rounded, hardwood chin-piece, preferably in oak, as the acid in this wood makes horses averse to crib-biting. The divisions should have hardwood heel posts, 1ft. in front of gutter and 5ft. out of ground, with all the arrises taken off, as should be done to all fittings, and the boarding to them may be 1in. rough, but in any case should not be tongued, neither tongued into the rails (as this makes repairs difficult at once), but nailed one side only, and kept off the ground to prevent decay. The doors should be 4ft. wide, and at least 7ft. 6in. high in two heights, and capable of being hinged right back and there fastened, as should all farm doors, whilst the windows should be of the hit-and-miss pattern, with glazing over, unless, having a lofty stable, you can put your light in front, but well above the horses' heads; or, better still, can bring yourself to put plenty of glass tiles in the back slope of the roof, than which there is really no better way of lighting (at all events for cowsheds) or of avoiding breakages. But

unless the roof is pantiled and glass tiles are being used, large sheets should be employed, as every joint forms a lodgment for dirt, and obstructs the light. For the paving in stables, a very hard brick will be required, or the iron-shod feet of the horses will make short work of it. Blue bricks on edge will make the cheapest efficient paving, or there is a red brick made at Skier's Spring, near Barnsley, which I believe to be just as good. The fall would be at least one in forty, and the gutter can best, perhaps, be made with bull-nosed bricks, and of sufficient width to allow free passage of a shovel. To insure the all-important ventilation the best and safest form is still that employed by our ancestors—namely, carrying the eaves well over, leaving out all filling between the rafters' feet, and raising every fourth or fifth ridgetile. A fodder and harness-room combined should be in connection with the stable, and approached from same. A small compartment opening out of same for chaff is a great convenience. Lofts running over the stables, with arrangements for bundling the hay down into overhead racks, are to be condemned on every score. To form side racks to mangers, the chin-piece should be carried through, bars let into same and carried down on to a brick pinning about 9in. high, and the bottom sloped up to the back so as to let out all the hay-seed and dust. The stables should have direct access to a horse-yard, with shelter-sheds in same, in the construction of which it must be remembered that the manure is allowed to accumulate to a depth of about 2ft. before removal, so that the eaves must be kept high enough to allow of it, and for the horses to pass beneath, about 8ft. is usual. They are often also made far too shallow, so that little protection is afforded the animals: 14ft. must be the minimum depth, and 2ft. or 3ft. more may be added with advantage. All the eaves should be spouted to prevent the manure being more rain-washed than is necessary, but I would not advocate horse-yards being entirely covered. In all shelter-sheds, cart-sheds, &c., where one has to employ posts let into the ground to take the roof-plates, one is troubled with the constant annoyance of rotting feet, and the attendant necessities of spurring them. I have seen various attempts to obviate this. An ingenious one, based on the fact of posts always rotting at the ground level, was to set them in a drain-pipe, the top of which was kept 6in. above the ground and filled in with cement; but the best is the use of steel joists bedded into a block of cement, and attached to the roof-plates with angle-irons, but should these be used, there must be bolted to both sides of the web, at least for a height of 6ft., a chamfered block of wood, or serious injury may happen to the animals. Cast-iron columns ought never to be used owing to their liability to fracture. The gates of all yards should be 10ft. wide, and hung to open outwards and fall right back. When there are gates between two yards they must be hung at least 2ft. up to clear the manure as it rises; and so, if the yards are ever to be used for pigs to run in, the bottoms must be fitted with elm slips, constructed like miniature gates, to work in grooves formed in the gate-posts. Palings make very bad fences between or around yards, but should they be necessary on the score of economy, do not point the tops, and let them be close, or an animal may get hung up and seriously damaged. For the same reason, keep the top rails of gates close enough to prevent animals ever getting their heads through.

COWSHEDS.

In treating of cowsheds, we come perhaps to the most important buildings which go to make up a homestead. Two kinds of sheds are in common use—those for single rows of cows and those where they stand double. No preference can be given to either system, except that in the latter, for a large number of cows, it will be cheaper if the building stands independently, as then one roof takes the place of two; but generally it is possible to arrange some of the sheds as lean-to's against a barn or some higher building on the north side, thus giving them welcome protection and making quite economical the roofing of a single shed. In a shed in which there are two rows they may either be arranged head to head with the feeding passage in the centre, which is perhaps most convenient, or tail to tail, with the dunging passage in the centre, and the feeding passage on either side; but as far as space is concerned, neither of these arrangements

is more economical than the other, as may be deduced from the following figures:—The feeding passage must never be less than 3ft. in width, the manger will take up 2ft., the standing 6ft. 6in. from manger to edge of gutter; the latter must be 12in. wide, and the dunging passage at least 4ft. I know to some the above length of standing may seem short; but should you make it more the cow will be nearly certain to foul its bed. I would even advocate a still shorter standing for Alderneys or other small breed of cows. It is usual to tie the animals in pairs, in which case the divisions need to be with 8ft. centres; 6in., or even 12in., less is often given this, but it leaves the cows very cramped, and also hampers the milkers. The divisions may be constructed in much the same manner as those described for stables; but the heel-post is better not so far back, or it will get in the way of the milker. It should certainly be 2ft. in front of the gutter and only about 3ft. 6in. high, whilst if it rises to 5ft. at the manger it will be ample. The construction of mangers is important, but little understood. Each cow should be provided with two bins, which means four bins in each of two-stall divisions, each bin capable of holding a bushel easily, and the bin next division in each case fitted with ventilated lid to hinge back and fix with button against it. The height should certainly not be more than 1ft. 9in. As to the depth, the usual custom is, for its ease and construction, to use an 11in. plank for the sides. They should be constructed of 1½in. plank, and the back plank, at least, should be well canted. Of course, no chin-piece need be provided. There will, however, want to be a support half-way between the divisions. How to prevent the cows pushing out the food into the feeding passages is a very difficult problem, and one which I have never seen satisfactorily solved. If you put a roll edge or projection at the back it would prevent a large-horned cow from getting at the bottom of the bin. If you can spare the room a ledge at the back with small curb or a canted plank is best. Far away the most common mistake in cowshed construction is the paving of the whole area up to the manger, and letting there be a continuous fall from manger to gutter. As to the paving of cowsheds, if it were not for the expense I should use V-grooved bricks, the grooves running only in the direction of the fall, as in economising litter it is very necessary that the liquids should pass rapidly to the gutters; but as a cheap paving I do not suppose a good bed of cement concrete finely faced can be improved upon. The gutters are very important, as in all districts the local sanitary authorities are now empowered to control the construction of cowsheds, and they will not allow any covered drains, but insist on the open channel being carried right outside the shed a distance of 12in. before the liquid manure is disposed of in any way. Long lengths are thus made necessary, which should clear themselves with a small flow as rapidly as possible. The standing next gutter should be terminated with a stone slab slightly rounded on edge; and the dunging passage, which is all at a lower level, should be sloped to same with a steeper incline as it approaches it. The paving of the feeding passages may be of rammed chalk or clay, unless trolleys are to be employed, when a concrete floor is necessary. The width of the door to the cowshed should, I think, be about 3ft. 9in. to 4ft. The sheds will naturally be built adjoining the yards, and unless you have covered yards with only dwarf walls between them and the stalls, it will be found convenient to have low doors somewhere at the ends of the sheds, opening into the yards, for throwing out the manure (the space beneath the windows can generally be utilised). Provision for calves should be made in conjunction with the cowsheds. Calving-boxes should have at least 180sq.ft., and, if drained, the floor should but slightly fall all one way to a gutter underneath one of the divisions kept up for that purpose; no gutter or other irregularity of the floor must be allowed, and a rammed chalk floor is preferable. The angles may have racks and mangers fitted across same. Bull-houses should be entirely independent, and open into stockyard. Mention should be made of cattle-boxes for fattening beasts. Eighty feet to 90ft. super is allowed for each box, and they should be built in ranges, divided by gate-like divisions capable of rising with the manure in grooves on either wall, and entirely removable. In constructing covered yards, 160ft. super should be allowed per animal. Free

ventilation should be provided in the roof, which should be of one span, and the gable ends should be covered in. Coming to what may be termed

THE ADMINISTRATIVE BLOCK

—namely, that which contains the straw barn, food stores, &c., this is generally a two-storied building stretching east and west, with the stockyards, &c., grouped and sheltered under it on the south, and the stackyard on the north. The food factory thus comes in its rightful position, between the food to be consumed and the consumer. The straw-barn now does not want to be of the size of the old threshing-barns, but only commodious enough to store about one day's threshing. It should be carried up the whole height, and have large doors 14ft. high for access, whilst, if possible, it should be arranged so that waggons can pass right through and out the other side through one of the stockyards. The floor may be of concrete, but the cartway would soon be broken up if of this material, and may best be made of wood. Next the barn is generally placed the mixing-floor, with the root-store adjoining, and only divided by a dwarf wall. Both these departments should have wide doors, so that carts may back right in. Over these departments are placed the cake-room, with its crushing machine and chaff-cutting machine, with their shoots to the mixing-floor, and beyond the granary, all connected together together for the convenience of trucking right through. The floors of these upper departments should be grooved and tongued, any skirting should be in cement, and the end of all joists and the spaces above roof-plates filled up solid, and the ceilings should not be plastered, lest there should be any hidden harbour for vermin. The roofing to these buildings must be quite weather-proof, and pantiles are not sufficiently so. It is difficult to give an exact rule for determining the size of a granary, but they are very useful of a good size, and 2½ft. super. per acre should be the minimum.

DUTCH BARN

are very deservedly growing in favour amongst farmers; their cost of construction is so little, and their usefulness so great, that they must be a good investment. Not only is all the cost of thatching avoided by their use, but in wet weather loaded waggons can be drawn beneath, and ricks dry much better under them owing to the free passage of air over the top. The waggons draw between the bays, so that these should not be less than 12ft. in width, and as cost is the only thing which governs the length that they may usefully be made, any multiple of that figure will do; whilst to admit of topped-up waggons passing through, they should be 14ft. high to the underside of plate, and, to afford protection to the load, they would best be 20ft. wide. As much space as possible should be left in the roof, and the whole fitted with gutters and down spouting, with the gable ends closed in.

CALTSHEDS

should, if possible, have a north-east prospect, and the openings not less than 9ft. in the clear; the height of these should be not more than 8ft. in order to keep out the weather as much as possible. As to depth, a single waggon or two tumbrils will require 20ft., but 30ft. will accommodate two waggons or four tumbrils. Knocking-stumps should protect the posts at entrance, and a guard-rail should be placed in front of the back wall. An implement shed for the more expensive implements is necessary, and should have an opening 10ft. wide, with doors to lock up, and provided with windows. If a toolhouse is provided—and it is very useful for storing ropes, rakes, forks, &c.—it may be best placed in conjunction with this. Before designing

FIGGERIES,

some thought should be given as to whether they should take the old form of covered sty and run, or the more modern box or pen. If the former is adopted, the chief necessity is to keep the covered lodging well above the level of the run to insure its being dry. But I would rather describe the boxes, as I believe them to be most useful. They should, if possible, be placed adjoining the stockyard. The boxes should have an area of from 80ft. to 90ft. super., with perhaps one or two rather larger as farrowing pens, and be separated by walls about 4ft. 6in. high. If a feeding-passageway can be provided at the back leading to the boiler-house at the end of the range, it will make a most compact department. A further labour-saving device will be to

SALE ROOM SKETCHES

FROM MESSRS FRANCES ROYAS

CHARLES COUCH ADAM AND SHERATON CHAIRS

C. I. M.

have the feeding-troughs midway between the pen and the feeding-passage, with a swinging shutter hung centrally above same, so that it may be bolted on the pen side in filling the troughs, and then swung back and bolted next the passage, throwing the whole into the pen. A guard rail 6in. wide and 9in. above floor should be placed round the farrowing pens. Pigs will soon rout up a brick floor, and I believe the best is again concrete, cement faced, as this is more impervious. The boiling-house should provide accommodation for several meal and swill tubs, and have a good-sized copper and furnace fixed in it. One or two good-sized loose boxes on the premises will be found useful for foaling and to act as sick boxes. Permanent sheep-folding yards are now acknowledged as a mistake, and become obsolete.

DAIRIES.

A housewife's dairy should have its main window north; but to get a fresher current of air I like another window east or west, which can be sheltered by bushes grown outside should it prove too hot. The walls should be hollow and the roof of thatch or plain tiles—certainly not slated. A settling-room should be provided with wide slate shelves around the walls, but not close up to same, a little space being left for the freer passage of air about the pans. It is customary to whitewash dairies throughout; but the whitewashing had better not extend down to the shelves, or, the pans being pushed carelessly back, will flake it off, and give you the real comic-paper article of milk with chalk in it. Two rows of any kind of tiles will obviate this. It is impossible, of course, without artificial heat to maintain a temperature of 58°, but this temperature should be striven for as nearly as possible. The butter-making department must have no drain inside the building; but the floor should slope to a channel outside, conducting into a gully. The ceilings in all cases must be ceiled, and everything conducive to the greatest cleanliness. The gauze should be on frames fixed outside the windows and easily removable for cleaning. As to

FARMHOUSE COTTAGES.

I will content myself with throwing out only two or three hints for your guidance. Do not waste your clients' money in providing a second sitting-room and laying on hot and cold water for a farm of a hundred acres. It will never win a tenant from the class of men who would wish for so small a holding. On the other hand, you will never get a tenant for a farm of larger acreage

unless most of the luxuries to be found in a modern two sitting-room house are present. Do not again, in striving after compactness, put your house so close to the stocksheds that after its erection one or other is proclaimed by the sanitary authorities uninhabitable. There is in this country a very tender bias towards progressiveness, so that in twenty years' time it may be deemed necessary to have the malodorous pig-sty fifty yards from the dwelling-house instead of thirty, as at present. Finally, in labourers' cottages do not put in less than a 2gal. copper, or they will not be able to brew enough to fill an 18gal. cask at a time, a serious inconvenience.

A vote of thanks to Mr. Cautley for his interesting and practical paper was proposed by Mr. H. P. G. MAULE, and was seconded by Mr. R. H. WAYMOUTH. A discussion followed, in which Messrs. C. H. HOOPER, HENRY TANNER, jun., G. PECHILL, W. A. FORSYTH, F. C. MEARS, and the CHAIRMAN took part. The vote of thanks was heartily accorded, and was acknowledged by Mr. Cautley.

DRAWINGS OF VENICE.

AT the Modern Gallery, 175, Bond-street, a collection of water-colour drawings and sketches by Mr. George C. Haité, R.I., R.B.A., entitled "Venice: Colour and Sunlight," are on view. Mr. G. C. Haité is a master of rich colour and sunlight effect, employed with a breadth and vigour well known to admirers of his work. We have before noticed these qualities, and in the drawings and sketches of Venice they are eminently true to nature. It would be impossible to do justice in a brief notice to the many works on the walls. Such small sketches as "Shop Doorway," "The Hay Barge," the quay scene (3), "The Bootyard, Rio Trovaso," are delightful studies of colour. In the latter work, and in "Fruit Stall, Murano" (5), "A Street" with three stalls of vegetables and fruit, and in several other studies we notice the painter's spontaneous methods as simple delineations of form. Other subjects of the same kind are "The Lido," with its foliage and water, and the glitter of lights on the latter; "Fruit Stall, S. Polo" (12), "The Market Boat," "Murano" (18), and many studies of St. Mark's and its piazza, so well known to the admirer of Venice. "The Glowing West" (16) is a gorgeous sunset, with crimson sky. We can only refer to the fine drawing, "The Lattere" (30), showing the portico of a church. This promenade has a fine

prospect upon the broad canal of the Giudecca, a scene dear to painters of sunsets. "The Piazza, St. Mark's" (52), "View from the Riva Schiavoni" (69), "The Giudecca," a view of the island and lagoons, with its stalls under awnings in depth of shadow, and the light on the gleaming fronts; "A Street Scene," "On the Lagoons" (49) are all charming sketches, of rich colour and sunlight. One of the finest and most finished works is "Under the Archway" (92), an arched recess, with fruit and flower stalls, above which is the upper-story window, with pendent national colours, very rich in colour and handling. The pencil studies, as "Fishing Boats," "A Study of Vegetables"; the fruit-stall studies in pencil, thinly tinted, are instructive examples of Mr. Haité's method. We recommend all lovers of Venetian scenery to visit Mr. Haité's marvellous studies in colour and sunlight.

SALE ROOM SKETCHES.

THESE three pieces of furniture, consisting of a Charles I. couch, a Sheraton and Adam chair, were recently sold at Messrs. Frances and Sons' Rooms. The Sheraton Chair, of mahogany with finely carved oval back and arms, on fluted legs, changed hands for £9. The Adam Chair, also in mahogany, one of a pair, fetching £15 10s., whilst the Couch, in oak with carved shaped head and back, on turned legs and stretcher, was sold for £9 10s.

INDUSTRIAL DECENTRALISATION.

AT the ordinary general meeting of the Surveyors' Institution, held on Monday evening last, a paper was read by Mr. Herbert T. Scole on the above subject, which the author well described as "an important factor in the solution of the housing problem." The President (Mr. Albert Bush), having recovered from his temporary illness, occupied the chair.

The author, premising that the subject was too vast and complicated to be dealt with in all its aspects, and especially from a historical point of view, proceeded to criticise some of the literature which had recently been disseminated bearing on the subject of industrial redistribution and the rural housing of town workers. It was argued by one writer on the subject that, in existing circumstances, labour was less efficient than it might be, that the stamina of the people was being reduced, and that, owing to municipal

monopolies, &c., the conditions affecting our manufacturers compared unfavourably with those in force with our rivals overseas. Some of the proposals of the "Garden City" scheme were severely handled by the author, who, while claiming to be in entire sympathy with the philanthropic aims of the promoters, could hardly consider all the details of their projects practicable. The "Grand Avenue," 420ft. wide, which was to traverse the city, sounded splendid, but these tremendous streets would cost a fair sum annually in maintenance. The circular railway, on the outskirts of the town, seemed rather less practically useful than if it could have served both sides of the town. It was not quite clear on what basis the original outlay on any individual holding was to be calculated; but the sites for factories were to be leased at £2 per employee, the home building lots at £6 each, and the agricultural portion at probably nearly £2 per acre. The building lots were to be 5,500 in number, and with an average area of 20ft. by 130ft., which at the rate given, 5½ inhabitants per lot, would work out at about 92 per acre: a fairly crowded population to begin with. One writer gave details of the system of water supply, by which all the spoil from foundations, building lots, factories, subways, &c., was to be thrown up into a huge retaining embankment of a great high-level reservoir 140ft. high. The cost of this Mr. Seeble reckoned, taking a low figure per cubic yard for moving, embanking, &c., at more than the total capital of the company, no account being taken of wells, pumps, windmills, steam engines, mains, machinery, service reservoirs, &c. On the whole it was easy to become enthusiastic on the housing question and to arouse sympathy by a recital of present woes and imaginary future bliss; but he feared the business side of the matter was too often relegated to the background. Proceeding to discuss the disadvantages of town houses, the author said these were sufficiently obvious. The cost of land compelled high buildings, whether for factories or dwellings. Rates were high, and the rateable value was also excessive, insurance was costly, not only on account of the height of the buildings themselves, but also of their close proximity to other premises. Delays in the transmission of goods, in or out, were frequent, and any enlargement of premises was often impossible. Water was an item of expense, and the disposal of trade refuse often a great difficulty. On the other hand, in the country land could be bought cheap, buildings could be made more spacious, lower, more widely apart, and consequently, cheaper, safer, more commodious, and more healthy. Insurance was lower, delays in transit less frequent, and any extension was easily accomplished. By choosing the site judiciously, cheap power and abundant water could in most cases be obtained, and, as a rule, trade refuse was more easily disposed of. Of course, there were cases where expense of distribution was heavy, quickness of execution of orders necessary, or, under other conditions, a central factory was most advantageous. Again, some industries were capable of absorbing large quantities of surplus produce of a perishable nature, and in such cases proximity to a central market was an advantage. So far as labour was concerned, high rent, overcrowding, absence of light and air and playing spaces for the children made town life unhealthy, unattractive, and, from a public point of view, dangerous to the community, and even in the model dwellings, where the overcrowding per room was avoided, the overcrowding per acre (sometimes as many as 700 per acre) was, if less apparent, at least equally dangerous. Clare Market had been rebuilt at a cost of £220,000 for 750 people, or about £300 per person, and if such an expenditure did not produce a fair return, the employers of labour in the vicinity of such publicly provided dwellings were surely being unfairly subsidised. In the country, a house to himself, a garden or allotment, and the enjoyment of sunlight and pure air, presented a happy contrast to the lot of the town worker. Tram, train, and cycle kept the artisan in touch with the town. The man was more with his family, his children were better, morally and physically, and he found healthy and even remunerative occupation for his leisure hours; and the general experience was that a man who had lived in both town and country would seldom be willing to exchange the latter for the former, though in exceptional cases the opportunities of employment for the junior members of the family and the proximity of technical schools and classes

inclined the artisan to prefer town to country. Many large firms—printers and engineers and others—had already migrated from town to country, and many more were on the move. Firms whose names were household words had laid the foundations of gigantic businesses in factories surrounded by the homes of their employes, designed and controlled under almost ideal conditions of health and prosperity. The settlements of Lever and Cadbury at Port Sunlight and Bournville were well known, and, as the author showed, under judicious management, were not only prosperous, but even commercially remunerative, while the dwellers enjoyed privileges of which the town-dwelling worker was ignorant. Among the factories which had for various causes migrated from London to the more open country, Mr. Seeble gave brief details of Messrs. Ransome and Co., Ltd., who, having been crowded out in Chelsea, had moved to Newark-on-Trent, with immense advantage to their working and their workers. Then he described the works at Lewisham, whither Messrs. Elliott Bros. had gone from St. Martin's-lane. In both cases one-floor workshops were the rule; overcrowding was avoided, driving-power was economised, and risk from fires so appreciably reduced as to effect a considerable saving in the cost of insurance. The model villages of Port Sunlight (where Messrs. Lever Bros.' workpeople were so comfortably housed) and Bournville (built by Messrs. Cadbury for the accommodation of their own operatives and others under healthy conditions and amid pleasant surroundings) were typical instances of what might be done by skill, consideration, and the judicious expenditure of capital. "Prosperity sharing" between master and man was a name well given to such an enterprise, for while the worker was in every way benefited, it could not be doubted that the master reaped the advantage of better and more willing work, less loss from sickness, and a more than commercial return on the increased efficiency of labour. At Port Sunlight, about 600 houses had been erected, the rents ranging from 5s. 6d. per week, including rates; and allotments, close to the cottages, could be had for trifling rents, including use of water. The general arrangement was in groups or blocks, with paved yards at the back, and small gardens in front, kept in order by the firm. Some £350,000 had been spent, including institutions, clubs, roads, parks, &c. At Bournville the cottages, which let at a rent of from 5s. 6d. per week, have large gardens at the back, with fruit trees planted along the intersecting boundaries, the dwellings occupying one-fourth of the sites on which they stand; while factories and shops are limited to one-fifteenth of the whole area of the estate. The 43½ acres under cultivation have been estimated to yield some £59 per acre per annum, or more than six times what could be expected from the land under ordinary agricultural cultivation. In this connection the author gave instances of the happy results which have accrued in the case of dairy management under minute personal supervision, such as was possible in communities similar to those with which he was dealing, and stated that one of the consequences of the cultivation of the soil by artisans and factory hands, each working his own garden or allotment, would, he hoped, be to supplement the foreign producer of vegetables, fruit, poultry, and eggs. By "intensive" cultivation, and the scientific and business conduct of farming and market-gardening, it might be possible to obtain a profit which would admit of the payment of wages favourably comparing, when all was taken into account, with the earnings of factory hands. In conclusion, he stated his belief that a very considerable movement of factories from congested areas to rural and suburban sites might very shortly be expected, and would demonstrate the enormous advantage to all concerned of the housing of the workers in the best practicable manner, and that the solution of the "housing problem" was to be found, not in municipal or philanthropic effort resulting in the erection of more and more dwellings in the large towns, nor in the increase of transit facilities, but in the establishment of country factories and model villages.

TECHNOLOGICAL INSTRUCTION.

THE teaching of technology is now a recognised branch of education. Since the Education Act of 1902 was passed great encouragement has

been given by the Board of Education to this subject. The report on the work of the department for the last session has been issued, and contains many interesting facts regarding the work. Attention is drawn to the arrangements made for grouped courses, and the substitution of attendance grants for those on examination results. By this course greater freedom is given to schools and local bodies in selecting subjects of instruction suitable to the trade of the district—a most important action, which has resulted in an increase in the number of technological classes and the number of students. Thus, we are told, registered classes have increased from 2,320 last year to 2,789 this year, and the number of students from 36,189 to 38,638. In the normal classes in woodwork or metal work, the students attending with a view to the teacher's certificate have increased from 1,908 to 2,367. Other figures given are certainly conclusive of a rapid increase. Effect has been given to the arrangements for co-ordinating the work of the department with that of the Board of Education, by which the entire work of a technical school, whether in science, art, or technology, is taken into consideration in the assessment of grants. The overlapping of subjects of examinations found to exist in some syllabuses has been to some extent prevented. Thus some of the examinations of the Board overlap those of the City and Guilds of London Institute; but these refer to a different class of students. The advantages of co-operation between the Board and Institute have been referred to by Lord Londonderry, Sir William Abney, and others; but we refer the reader to the report itself. The Institute has done a great work, it has rendered a useful service in the guidance of local efforts, which are of value to our great industries. The Scotch Education Department, the Department of Agricultural and Technical Instruction for Ireland have availed themselves of the Institute's services. Several tables are given showing the development of technological instruction, the results in separate subjects. In the building trades, mechanical and electrical engineering, and textile manufactures, the increase of candidates has been considerable. The largest number in any one subject is in electric lighting. In carpentry and joinery there were 1,729 candidates, in plumber's work 1,479. Looking over the tables and the reports of the examiners, it will be observed that the most evident faults in the written parts of the examinations are due to defective school training—"to the students' imperfect knowledge of the elements of physical science and of drawing, and to their inability to express their ideas in written language. This is the general burden of the complaint." No improvement in the answers is looked for until the teaching in elementary schools is more practical, and more attention is given to drawing and scientific method, and English composition. The power of expression involves clearness of thought—almost as necessary to the artisan as technical skill. The failures in the preliminary examinations are due to this cause. The percentage of failure is very high in electrical subjects, such as the wiremen's work. The remarks of the examiners given in the volume before us are instructive. Referring to this special work, the examiners say: "In the majority of specimens (metal joints) sent in for examination, insufficient attention had been given to effective insulation. From the way in which prepared tape was used by most of the candidates, it seems that they regard such tapes as an insulator, whereas it should only be used as a mechanical protection. Non-removal of tape from the original rubber of the cable, before insulating the joints, was the cause of many failures." It is important, as the report says, from the view of the insurance of buildings against fire, that a high standard of qualification should be required. In regard to plumbers' work the same fault is found; grasp of the rudimentary principles of science underlying plumbers' work is still far from satisfactory, and shows the inadequate school training of apprentices who enter for instruction. Candidates for examination in mechanical engineering have increased, but the failures are high, and the examiners attribute these partly to attempting to pass in the same year two parts of the examination in the ordinary grade. A large number succeed in Part II, who fail in Part I., where the questions relate to mechanical principles, bending moments and shearing force, and to various definitions of stress. We can only notice a few of the other subjects as mentioned by the examiners. Brickwork examinations show a lack of observation;

as to No. 2 question, it is said that many candidates make the mistake of putting the thicker wall outside. This presumably applies to cavity walls; if so, the point is at least debatable. The thicker wall outside gives some advantages: deeper reveals, greater strength to resist external violence, and better means of bonding. In masonry the ordinary grade answers were fairly good, but the honours grade papers far from satisfactory. Drawing is also weak. In many instances elementary knowledge of solid geometry is very imperfect. In other trades the results show a want of more thorough study of elementary facts and principles. In builder's quantities the number of candidates has increased. Much time has been wasted by squaring dimensions, abstracting, and billing, so that less time has been bestowed on other subjects. We must reserve our remarks upon other portions of this report, which contains many points of interest. A large portion of the volume is occupied by the questions set in the examinations, which are instructive. Many of these are illustrated by diagrams. On the whole, the results are satisfactory; but the general complaint of the examiners is the same—that the candidates show an inadequate general knowledge, and few have grasped the whole field covered by their subjects, they are deficient in the power of expression, and careless in reading the questions.

LOCKS AND LOCK FURNITURE.

A NEW illustrated lock and furniture catalogue has just been published by the eminent firm of Messrs. Hobbs, Hart, and Co., Ltd., of Arlington-street, Islington, and 76, Cheapside, so well known for their manufacture of every kind of mortise, rim locks, lock furniture, strong rooms, and safes. This company are the patentees and manufacturers of so many lever and protector locks of every description that a simplified arrangement, by which buyers can select and describe the particular class, quality, and price of every article, has become essential, and for this purpose they enumerate the registered trade marks. This is necessary, because of the many imitations of the goods, of good external finish, but devoid of the qualities of security and wear. Hobbs and Co.'s patent Protector locks "combine the principle of lever security against the use of any but the true key, of the movable stamp security as a protection against picking, and the revolving nozzle security as a protection against fraud." No lock is really secure without these three ingenious essentials, which are described in detail. Those in search of a lock secure against picking and fraud will find a careful perusal of the pages of this catalogue amply repay them. We can only glance over the numerous examples of the company's Patents, Protector and Lever locks, and specialities. The "Lever" machine-made locks, depending on a series of levers which require to be raised to unequal positions, according to the steps of the key, are perfect in their mechanical arrangements. By means of change of key-cutting machines, immense changes of key differences are insured. On page 8 we have a list of patents having relation to improvements and inventions in locks and lock furniture, safes, doors, &c., which show a great variety of effect, to meet numerous requirements in the arrangement and construction of locks and fasteners for all purposes. The selection of presentation keys in gold and silver manufactured by Hobbs, Hart, and Co., from special designs, and of fancy bow keys for mortise and rim locks are very interesting from an artistic point of view. Thus we see the Constable's Key, Tower of London; the Westminster Town Hall presentation key; Art School, Sheffield; and keys for various other municipal buildings. Special sets of locks for hospitals, infirmaries, &c., are illustrated. These are made to differ, singly or in sets, as required for male or female sides, stores, medical and administrative departments, with sub-keys to each set, and with master keys to pass, &c. Then we have locks on suite for hotels, mansions, public buildings, each lock having its own key to differ with sub-master's keys for certain respective floors, and master keys to pass all. Mortise and rim locks are made to order in sets, and may comprise two-bolt locks, dead-locks, and latches. Illustrations and descriptions of mortise-locks, the "Cheapside" lever one-bolt mortise, two and three-bolt mortise locks, will be found of value in specifying. The former is a moderate-price and excellent mortise,

described as "6in. by 3in., two brass bolts, brass bushed follower, one key," priced at 5s. 3d. each. The particulars and plans given for ordering locks, whether right or left-handed, and the way the door opens, are, of course, very necessary to be observed. The "one-bolt mortise lock" is made with full lever security for use of knobs on both sides, the keys locking up the bolt internally. These are priced from 4s. 6d. to 8s., according to number of levers. The "Universal" 4-way mortise locks, by which the latch bolt can be actuated by turning, by pressure, or by lifting knobs, are ingenious, and afford facilities for opening and closing door of dining-room, &c., while both hands are full. Several kinds of "lever and patents protector" mortise locking catches are illustrated and priced of two qualities; these are suitable for street doors for mortising in the middle rail. The flush drawback night latches and locking latches, and the jannaped lever and "Patents Protector" rim dead locks are of superior make. The "Patents Protector" and lever mortise combination bolts and locks adapted for doors of banks, warehouses, &c., offer great security as the bolts are thrown up and down, as well as into the frame. Hobbs and Co.'s "Violence Protector" locks for safes and strong-room doors are perfectly devised mechanical arrangements, providing a series of movable retaining stumps, any one of which would retain the bolt in position. We also notice Hobbs' "Patent Bankers' Protector Treble Action Transmutation Key Locks." Other pages of this useful catalogue illustrate locks for wardrobes and cabinets, patent slotted steel spindle furniture, knobs repousse, and other lock-plates and finger-plates of artistic design, door handles, and many other descriptions of furniture and fastenings. We recommend the architect and builder to consult this excellent catalogue.

IRISH BUILDING STONES.—III.

CLARE.

THE rocks in this county are Lower Coal Measures (Millstone Grit) 290, Upper Middle and Lower Carboniferous Limestone, Lower Limestone Shale, Old Red Sandstone; Upper and Lower Silurian, Trappean Ash, Greenstone, Diorite, and other Igneous rocks. In the Limestone series there are beds of Magnesian Limestone deposited as such, and Magnesian Limestone, which is only Metamorphic Carboniferous Limestone: in neither case does the limestone so classed belong to the Permian rocks. Ennis is built on Upper Carboniferous (Burren) limestone; Kilkee on Coal Measures; Kilrush, Coal Measures and alluvium; Killahee, Old Red Sandstone, Alluvium, and Silurian rocks. Carboniferous Limestone and Millstone Grit cover the whole area of this county. A line passing nearly due north and south, about five miles to the west of Ennis, roughly marks the boundary between them, the Millstone Grit occupying all the county between that line and the Atlantic Ocean, extending from the barony of Burren to the mouths of the Fergus and the Shannon. The newest rocks in the county are the Lower Coal Measures or Millstone Grit, and they yield valuable building and paving stones all over the district indicated above. The most important quarry, or rather series of quarries, in these rocks are now worked by Messrs. Watson and Son, Ltd., of Tower-buildings, Liverpool, and they furnish stone which the proprietors describe as "clean, hard grey Millstone Grit." It belongs to that division of the Clare Carboniferous Sandstones known to geologists as "Clare Flags." This particular sandstone is nearly pure silica—that is, the material is built up with grains of silica imbedded in a silicious cement, the whole being so hard that it is unworkable by any machine hitherto invented. The strength of this flagstone is remarkable: it carries from 1,711 to 2,214 tons to the square foot before being completely crushed. It is, therefore, stronger than Aberdeen granite, which fails with from 900 to 1,300 tons, York stone with 530 tons, or Northumbrian millstone grit with a little over 300 tons. The stone raised at Doonagore quarries is invaluable to builders where it is necessary to support great weights, which are concentrated on small bearings, as, for example, at the ends of girders. Templates of the very hardest and most refractory stones should always be used to distribute such loads over the largest possible areas of any underlying walls or piers, and this end may be attained by using an exceptionally

hard flagstone of sufficient thickness, without risk of failure. The labour on working these beds makes it fortunate that they may be raised from the quarries with surfaces as true as if they had all been carefully sawn and planed by machinery before being placed there; but for moulded or other dressed work of a similar character such stone is entirely unsuitable. Slabs and landings have to be squared by hand, and no better material than the stone scabbled or pitched off in doing this can be obtained for first-class walling. The face of each stone may be left "rock-faced," just as it comes off the parent block, or it may be dressed with the chisel to a fairly even surface: in any case the thickness of each course will be the same all round the building, and this without any additional expense whatever. The uniformity of such coursed walling will naturally be broken against the quoins, each of which will rise as high as three or four courses of the rubble work. The same remarks will, of course, apply to the flagstones of the Carboniferous rocks in England and Wales, the waste of which the writer has frequently used for wall facings in the manner indicated. It is not easy to understand why architects so generally neglect to use the waste of self-bedded stones for walling, especially in districts where they are common, and consequently almost valueless, for they make much handsomer and more durable work than any brick or terracotta. The neglect of this and similar material may perhaps be accounted for on the supposition that the architect is becoming, every day, more of a draughtsman than a builder; indeed, the constant failure as well as the misapplication of costly materials, seen on every hand in the City of London and elsewhere, can leave no doubt whatever on the mind of any thinking person that much of our practical architecture has fallen into the hands of amateurs, who may consider themselves artists, but who have no shadow of claim to the old title of "master builder," which comprehended that of designer, builder, and clerk of works, when our best buildings were erected. To anyone having the most elementary knowledge of the building work done in this country from the Norman Invasion down to the end of the 15th century, and its consistent gradual development, it would be simply impossible even to imagine the builders of that time erecting such absurdities here as a Grecian temple, or a Byzantine church copied from one erected at Constantinople centuries before, no matter how suitable the arrangements of the latter may have been, for displaying the sensuous and elaborate ritual of the Romish Church in the Middle Ages. As generalities leave no very definite impression on the mind, there is not much to be learned from them. So the following particular explanations will perhaps help to make the writer's views clear in this matter, and if he succeeds in doing this it will be a sufficient excuse for a rather long digression from the special subject matter of this article. An architect should have a thorough knowledge of the properties of building materials, and this knowledge he never can attain as long as he is content to deal only with lines which represent them on paper, for such lines can by no possibility suggest all the various uses and adaptations, as well as failures, which are patent enough to one who handles the actual material for himself, and not through a deputy, whether he is a surveyor or clerk of works. To enforce this, take the following examples: A large brick-fronted building erected in the City of London 30 years ago, at a cost of nearly a quarter of a million pounds, may now be seen, with the whole of the mortar pointing in an advanced state of decay. If the architect had known anything of pointing, or if he had had even the smallest amount of knowledge as to the properties of lime, cement, and sand, such an ignominious failure would have been impossible, and the work would be stronger now than when it was executed. As it is, the architect's neglect or ignorance will cost his clients several hundred pounds. At another building, which must have cost quite as much money, an expensive wrought-iron railing may be seen let into red terracotta plinth blocks, every one of which is split from end to end by the rusting iron; yet with this object lesson before him, the architect, a man in large practice, has actually duplicated this inept piece of construction within the last few weeks. Again, on the ground floors of several buildings in main thoroughfares massive granite voussoirs, strong enough to key the arches of Waterloo Bridge may be seen supporting no greater weights

than sheets of plate glass not more than $\frac{1}{2}$ in. thick. At the same time, these buildings are faultless imitations of Mediaeval or Renaissance structures erected in Germany and Italy centuries ago, and which therefore have no connection whatever with modern ideas, modern thought, or modern business necessities. No man, who was a master builder in the old sense of that name (that is, one who had a knowledge of building construction and knew how to build), could do such things, and as many such practical jokes in stone, terracotta, brick, and mortar are perpetrated by insurance companies and bankers, one cannot help wondering how they take care of other people's money when they are so prodigal with their own. To return to the Clare quarries: Messrs. Watson employ 160 men at Doonagore and Ballysara, and their steamers run between Liscannor, the shipping port in Clare, and Liverpool. This flagstone may be seen in use for templates in the new War Office buildings at Whitehall. Other quarries in these rocks are Caherbarna near Liscannor, worked by the Liscannor Quarry Co. Ltd., with 24 men; the Lough South, another quarry near Liscannor, worked by the Lough South Quarry Co., Ltd., with 78 men; Knockerra West, worked by Mr. J. B. McLachlan with 14 men; Money Point, by Bedelia O'Grady, 14 men; and Kinneliety, Moher Cliffs, 8 men. At Eonis'mon the beds of rock vary in thickness from 2 in. to 10 in., the stone is a dark grey colour, hard, compact, silicious, and consequently hard to work. The Money Point quarry, near the Shannon, turns out flagging like that raised near Carlow. The surfaces of the beds are rough, being marked with the tracks of marine worms and other animals. The latter stone was formerly cut, worked, and polished for chimney-pieces at the Killaloe Marble Works; but this trade died out about fifty years ago. Good flags are also obtained at Crag, near Kilrush. Between Kilkes and Miltown Malbay the Coal Measures are cleared, and yield true slates. They were at one time extensively worked, but there are no slate quarries in this district at present. The next formation in descending order is the Carboniferous Limestone, and it makes an extraordinary show in the north of the county. The hills of Burren are formed of bare limestone rock, which rises, terrace after terrace, to a height of 1,000 ft. above the level of the sea. The joints in this limestone are numerous and regular, each terrace floor, which is level and nearly 20 yards wide, being cut by them into large blocks of quadrangular and triangular shapes. For a distance of over 20 miles there is no trace of a fault or disturbance, or even an undulation of any kind in these beds, though their entire thickness in the district cannot be less than 1,700 ft., all good solid building stone without a parting of clay or shale. Professor Kinahan, a leading Irish geologist, divided the Carboniferous Limestone into four subordinate groups by lithological characters, which were constant locally over fairly large areas, and he was supported in this by Mr. Foot, another competent man; but Professor Jukes declined to accept the arrangement, as it was not justified by palaeontological evidence depending on time. But a lithological character is of more importance to the builder than that derived from fossil contents. Professor Kinahan's classification will be adopted here. The great mass of limestone already described constitutes such an important and distinctive assemblage of beds that it has been named "Burren Limestone," from the barony in which it occurs, and it forms the lightest division of the Irish Carboniferous Limestone in the west and south of the country. The Burren Limestone varies much in thickness. It attains its greatest development along the shore of Galway Bay; but it thins out on the south-east, towards the County of Limerick, from 1,700 to about 240 ft., the underlying "Calp" taking its place, and this in a distance of not more than thirty miles. On turning back to the quarries of the English Counties, already published in the *BUILDING NEWS*, it will be seen that towards the north the English Lower Carboniferous rocks are divided into (1) Yoredale Beds, (2) Carboniferous Limestone, and (3) Lower Limestone Shale, Millstone Grit forming passage beds into the overlying Coal Measures. In Ireland the Lower Carboniferous strata are differently divided. Kinahan finds the following series in descending order:—

- (1) Burren Limestone and Calp both together forming an upper subdivision;
- (2) Fenestella Limestone and Shaly Limestone, forming a lower subdivision;
- (3) Lower Limestone shale;

and (4) Old Red Sandstone, the basal beds of the whole. The Burren and Fenestella Limestones are frequently so hard and compact as well as being crystalline, that they yield good marbles when polished; cherty veins are found in both, these varying in thickness from 40 ft. to 100 ft.; the finest and best blocks for ornamental work are obtained from them. The whole series of Lower Carboniferous Rocks, including the basal beds, is not less than 2,750 ft. thick in North Clare; but there are few quarries, for surface blocks of good building stone are found scattered all over the county, and these are used for general building purposes. The writer built a church in Burren about 40 years ago, and the whole of the limestone used for walling and dressings was simply lifted in large square blocks from the surface of a field adjoining the churchyard, no quarrying of any kind being necessary, beyond splitting the stones with wedges to the sizes required. Large blocks were broken without much waste in the following manner: Along the top bed a line was drawn indicating the direction of the required split; about 6 in. apart on this line holes 3 in. by 1 $\frac{1}{2}$ in. by 3 in. deep were sunk with a chisel, and shallow grooves were cut down each side, continuing the line from the top to the bottom bed, when wedges were simultaneously driven into the holes with sledges, a crack was seen to run from one hole to another, and down the sides, the block having been divided into two almost as well as if it was cross-cut with a saw. If the Romans had invaded Ireland it might well be thought that Ennis Court House, built with Burren limestone, was a building designed by Vitruvius for the Emperor Augustus, and that its purpose was the worship of Jupiter Stator, or some other equally shady Roman god. Its orthodox portico and pediment, and its windowless front walls, all testify to the facts that modern architecture is a mere imitative or bedding-out process, and that architects are content to erect buildings copied wholesale from others in foreign lands, which have no conceivable connection with, and in no way satisfy, modern wants or modern requirements. It has been stated that Burren limestone is bedded, a peculiarity which makes it specially valuable to the builder. The underlying Fenestella limestone is, however, not bedded; it is massive and irregular, its characteristic colour being bluish-grey, but there are red and purple beds found in it on various horizons. Fenestella limestone is so called from the coral of which it is mainly composed. Some beds are nevertheless quite unfossiliferous and cherty, with numerous veins of calcite traversing the stone. This change, which is one of a more or less metamorphic character, is probably due to the presence of erupted igneous rocks, which are always found in close proximity to the cherty beds. The blue and coloured Fenestella cherty limestones all yield excellent marbles. They are not used at present, but at one time some quarries between Newmarket and the Shannon yielded handsome red and clouded red and grey blocks, which were worked and polished for ornamental purposes. Though there are 306 quarries, or spots where good stone may be raised, shown on the Ordnance maps of this county, there is not one limestone quarry at present scheduled as being under Government inspection. About a mile from Ennis a dark-grey semi-oolite crystalline limestone was quarried, which worked freely, but the blocks turned out were of small size. A similar stone is found at Beesley Park, the blocks being of much larger size; both have been used in building Ennis Court House and Gaol. Old Red Sandstone, or as Kinahan calls it, Lower Carboniferous Sandstone, is found in a few places only, as outliers. The colour varies from nearly white to purplish red. The stone works well, and is durable; it may be seen in the old cathedral at Killaloe. Much of the "old red" used in this county for building was, like the limestone, obtained from surface blocks which are found scattered over the hills to the south-east of Newmarket. Those quarried at Ballyheigue, and sold at 2d. per cube foot, was extensively used in the Shannon Improvement Works (1842); it stands well. A good sandstone is also found near Mount Shannon, close to the Galway County boundary, but all these sandstones are highly silicious, and wear down the tools rapidly, though the felspathic matrix in which the grains are bedded make them rather free working in the banker.

A Killaloe chimney-piece was a common item in an Irish specification 80 or 100 years ago, as "Ryegate" hearthstones and corings were in English specifications of the same period; but as

there was no Mr. Chamberlain on the warpath at that time, foreigners "dumped" their goods on our markets; and the Belgians subsequently supplied our architects and speculating builders with marble chimney-pieces at less money than they were paying for the same fixtures in sandstone and limestone, and this "ruined the home industries." Now that there is a prospect of what is facetiously called "fiscal reform," the imported article may be driven out of the country, and then builders will once more have to go to Reigate and Killaloe for their chimney-pieces, hearths, and covings. All the Silurian strata in this county, which are found in isolated exposures to the north and west of Killaloe, yield coarse roofing slates. Some of the best veins are unfortunately ruptured by faults, and consequently the workable rock is found in small pockets only—a mode of occurrence which makes it impossible to work the slates extensively and economically. In this district the Slieve Bernagh hills, and nearly all the surrounding country have at one time or other been searched for slates; quarries were found at Broadford, Knockpryse, and Craiglee, near Lough Derg; but none of these were worked for any length of time, except one at Broadford, which yielded unusually good slates, but this was also closed on account of heavy land carriage to the nearest shipping place. If a company similar to Messrs. Watson's was incorporated to work the limestones of this county, it would no doubt be financially successful, for stone is plentiful, and it comprises several beds of marble; labour is cheap, and in several districts water carriage is available for the transport of rough or worked material. To the architect in search of quaint buildings worth measuring and plotting, it may be pointed out that there is an ancient abbey at Corcomroe, on the road between Ballyvaughan and Kinvarra, which, though little known, is well worth a visit; Burren stone is used in this building, and even where it is exposed to the weather the tool marks on the dressings are as sharp and as clear as when the stones left the banker.

CORK.

The rocks in this county are Coal Measures shales and grits, Upper and Lower Carboniferous Limestones (262, 274, 296, 319, 332), with magnesian beds as deposited and altered; Lower Limestone, Shale, and Slate (344), with Coomhola grits; Old Red Sandstone (281, 298, 338); Greenstone ash and Diorite. Cork is built on Alluvium, Old Red Sandstone, and Lower Carboniferous Limestone; Cove, Lower Limestone, Shale, and Slate, Old Red Sandstone; Bandon, Lower Carboniferous Limestone; Fermoy, Old Red Sandstone, Alluvium, Lower Carboniferous Limestone; Kinsale, Lower Limestone, Shale, and Slate; Youghal, Old Red Sandstone, Lower Limestone, Shale, and Lower Limestone. The newest rocks in this county are the Coal Measures, Upper, Middle, and Lower having representatives here, the whole being about 3,500 ft. thick. They are found in the North only; the Lower and Middle divisions are absent in the South-West, the Lower only being present, its thickness being about 200 ft. Every attempt made to correlate the Irish Coal Measures with those of England have failed. The probability, however, is that they are about the same age as the Culm Measures of Devon. The Coal Measures of Cork are Metamorphic rocks, as the coals are anthracite, and the associated rocks are Grits, Shales, and Indurated Clays. The metamorphic action, whatever may have caused it, was not great, for none of the fossils in the partially-altered rocks have been obliterated. There are no workable coals in these measures. The West Cork Coal Measures are seen in Whiddy Island, Bantry Bay; near Ballinhassig, Carrigaline, and in the Oldhead of Kinsale. They generally rest on the Carboniferous Slate, the limestone being absent. The latter begins to show about Carrigaline as an earthy calcareous rock from 10 ft. to 15 ft. thick. Coal Measure Sandstones are worked here for local use only. They are generally argillaceous rocks, the basal beds being flaggy grits of not much economical value. The Lower Carboniferous rocks yield limestones, marbles, sandstones, and slates are valuable building materials. The Cork red marble is celebrated for its rich and permanent colour. Little Island red was used in Liverpool Exchange, the Museum, Oxford; St. John's College, Oxford; and other places. Fermoy red in the R.C. Cathedral, Queenstown; the R.C. Church, Thames-street, Dublin; and the Middle-

ton Grey in St. Mary Abbots, Kensington. Cork red marble was also used at St. Mary's Church and the St. Pancras Hotel for the Midland Railway Company; in fact, the best Irish red marbles are procured in this county, the principal quarries being at Boreenmanagh, Churchtown, and Little Island near Cork, Johnstown near Fermoy, and near Buttevant. Kinahan describes them as being red like jasper, streaked, variegated, and some semi-transparent. The Middleton marble is a clouded grey. In the Carboniferous Slate, near Castletown Berehaven, there are dykes of a pale yellowish Pyrophyllite, which, when polished, makes an ornamental building stone. Though Cork is a large county, there is not much Carboniferous Limestone in it. What is found there occurs in the valley of the Lee near the city, and eastwards to Youghal; it is also seen in the valley of the Blackwater. There are about 50 quarries now in work for limestone and marble, the principal being Little Island, Caherlag, Mr. D. Cantillon, 28 men; Meelin, Mr. Ryde Holland, (for Major. Aldworth), 58 men; Broomfield Middleton, Carrigtuehill, Castlemere, Crookstown; Farramastigue and Gill Abbey, Cork; Grange, Fermoy; Parknorth, Ramhill, worked by Mr. R. Colles, of the Kilkenny Marble Works; Spa Glen, Tulladuff, Liscarroll; and White Rock, Middleton. All these limestones are light grey, close-grained, compact; they work well and freely. These properties characterise the normal building stones here. In exceptional cases, as at Ramaher, near Kanturk, the rock is very fossiliferous, and difficult to work. Some beds are splintery, like those found near Mallow; but, on the whole, the Cork Limestone is second to none as for working, everlasting weather stone. Ballentemple stone was used by Burges in the miniature French church which he built in St. Finn Barrs parish, Cork, as a cathedral for the diocese; it was also used in the columns of the Court House. The lower Carboniferous rocks ("Old Red") of Cape Clear Island were used in the banks and a chapel at Skibbereen; the Clonakilty sandstone was used in the court-house there; Theval sandstone in the Martello Tower at Bantry; and Youghal sandstone in the barracks and buildings generally in that town. The Cork "Old Red" is a slaty rock of a deep purplish colour mottled with green, totally unlike the "Old Red" of Hereford and Brecon, which is compact and micaceous. The rich red sandstone used for walling in SS. Peter and Paul's Church, the R.C. cathedral, and other buildings in Cork City was quarried at Glanmire, and this stone, unlike other Old Reds, can be joint-bedded without impairing its weathering qualities. Sandstones and Grits are the principal building stones in this county, and they belong to the Lower Carboniferous or "brown stone," the yellow sandstones or Coomhola grits, known as "grey stone," or to the Silurian rocks.

THE PALACE OF MINOS.

At a meeting of the Hellenic Society, held on Tuesday at Burlington House, with Professor Butcher in the chair, Dr. Evans gave an account of his most recent excavations of the Palace of Minos, at Knossos, in Crete. The result of the last season's excavations on the site of the Minoan Palace at Knossos, he said, has been specially important from the stratigraphical point of view. Below the foundations of the latter building fresh evidence had come to light of the existence of an earlier palace, the contents of which showed connections with the Twelfth Dynasty of Egypt, and revealed a high development of civilisation by the middle of the Third Millennium before our era. Below this level, again, were structures belonging to a still earlier civilised stratum, which, in turn, overlaid 25ft. of Neolithic deposits. Besides these remote stages, a remarkable series of discoveries had now made clear the existence of an earlier stratum in the later Palace. It now appeared that below the paved floors of rooms and corridors belonging to this concluding period—itsself of considerable duration—were remains of magazines, and notably of a whole series of stone receptacles which had been definitely closed at some time of great disturbance—approximately about 1800 B.C.—and the later paved floors built over them. Several of these repositories belonging to this penultimate period contained quantities of gold-foil and remains of Cypress-wood chests that had been inlaid with plaques of crystal and faience, and which, doubtless, once contained treasure. The two most spacious and

important of these repositories were filled with relics of a sanctuary, including faience figures of a snake goddess and votaries, exquisite inlays and reliefs of the same material, tablets showing a new intermediate form of script, and clay sealings that had belonged to priestly documents now perished. It was remarkable that several of these bore religious symbols in the shape either of a plain cross or of a *crux gammata* or "Swastika." But the great surprise of the excavation was the discovery of what seemed to have been the central object of cult, in the form of a marble cross of orthodox Greek shape. Dr. Evans referred to other pre-Christian survivals of this symbol which seemed to fit on this Minoan cult. In the same way, the Minoan idea of the dove as Divioe intermediary had also showed itself very persistent. These remains belonged to what appeared to have been an extensive sanctuary in the west wing of the Palace, including the pillars incised with the double axes. A dependence of the Palace on the north-east, also recently excavated, showed a marvellously-preserved Royal villa, with flights of stairs and remains of upper stories, the principal hall of which afforded an extraordinary anticipation of the later basilica.

At a meeting of the Fellows of the British Academy, on Wednesday, Mr. Arthur Evans read a paper on "The Pictographic and Linear Scripts of Minoan Crete and their Relations."

Mr. Evans briefly traced the earlier stages in the evolution of an indigenous system of writing in Crete, as brought out by his researches from 1893 onwards. Finally, in 1900, his discovery of the clay archives in the prehistoric Palace of Knossos had supplied conclusive evidence of the existence of both a semi-pictorial and a linearised system of writing of a highly-developed kind. The relations of the two scripts, however, had remained obscure, as, owing to the circumstances in which the tablets of the pictographic class were first discovered, there was no proof that the two styles were not contemporary. The recent exploration of strata below the later floor-levels now showed that the pictographic inscriptions really belonged to an earlier Palace belonging to the "Middle Minoan period," and already displaying a high civilisation, together with indications of contact with XIIIth Dynasty Egypt (c. 2500-2200 B.C.). Mr. Evans was also able to establish various new facts with regard to this conventionalised pictographic script. The numerals, like those of the later linear script, proved to belong to the decimal system. It was also possible to trace the order of the writing in many cases. What seemed to have been a dynastic revolution destroyed the earlier Palace about the close of the third millennium B.C. In the later Palace, which came down to about 1500, a new linear system of writing was found established. In what relation did this stand to the earlier quasi-pictorial class? The most recent excavations had now produced new comparative material of the highest interest. It appeared that the later Palace itself was divided by some internal disturbance, probably involving some change of Government, into two distinct periods. Chambers and repositories were found below the later floors of this Palace which belonged to an earlier period in its history. The most important of these repositories containing relics from a sanctuary, the central cult-object of which seemed to have been a marble croc, also presented clay tablets and sealings with inscriptions in a form of linear script in several respects divergent from that of the latest Palace period. In certain respects, as in the form of the tablets, the numerals, and some characters, a greater approach to the pictographic types was visible. It did not, however, wholly represent an anterior stage of linear writing, since some signs common to this and the other class appeared in a somewhat more advanced form. It was therefore to be regarded as a parallel and alternative script superseded by the other owing to a dynastic change. It further appeared that this script answered to that of inscriptions brought to light by the Italian Mission in the small Palace or Royal villa of Hagia Triada in this and the preceding year, as well as an inscription found by the British School at Palaikastro. The two linear systems had a large element in common, and together revealed a considerable indebtedness to the earlier pictographic signary. The identity of certain sign-groups, moreover, showed that the language of the two was essentially the same. The linear tablets of the latest Palace period were much more abundant—about 1,600 having now been discovered. Besides

inventories of precious vases, ingots, chariots and horses, arms, and other possessions, the meaning of which was partly made clear by pictorial illustrations, there were other clay documents which might prove to be deeds or private records. Ink-written inscriptions on vases also existed, pointing to the former existence of writings on papyrus or other perishable materials. Very important were long lists of men and women giving what must certainly be regarded as personal names with the "man" or "woman" sign attached to each. A comparative study of these names enabled Mr. Evans to trace the existence of male and female terminations, and of hanging suffixes, as well as of compound formations of similar type to the Indo-Germanic. Both linear scripts were provided with a decimal numeration, including signs up to 10,000, and tablets dealing in percentages further showed its prevalence. Most signs seemed capable of an ideographic as well as a syllabic or possibly in cases alphabetic usage. The artificial variations in certain signs, to supply different nuances of sound or meaning, betrayed the grammarian's hand. Among the conclusions that might be deduced from the evidence of the different forms of script were: (1) Its indigenous development; (2) unity of language in Minoan Crete going back to a remote period, and probably corresponding to the Eteocretan language found later in a Greek guise at Prasos; (3) consequently an ethnography altogether different from that of the Homeric tradition, which included Achæans, Dorians, and Pelasgians, as well as the Eteocretan element; (4) clear evidence that the language was not Semitic. In conclusion, Mr. Evans pointed out the parallels existing with signs of the Cypriote Syllabary and the suggestive correspondence of many characters with the probable prototypes of Phœnician letters.

HUDSON AND KEARNS' DIARIES.

THERE is really but one alteration in these excellent diaries and blotters to note for 1904—namely, that it is once more leap year, and has to be provided with the usual extra day in February, after an unusual interregnum. Whether this is likely to be an advantage to any of us, or the reverse, is in the hands of fate, and in no way to be debited or credited to Messrs. Hudson and Kearns, who may contentedly await the repeated verdict, that no better business aids than they provide can possibly be bought by the professional man or the trader. The architect and the builder are especially indebted; for the specialties at their command embody every requisite, while neither age can spoil nor custom stale the infinite variety and completeness which combine to save the time and labour of users.

"Nobody earns
Like Hudson and Kearns
Heartiest thanks for so many good turns"

is our sincere acknowledgment, and we know it is heartily endorsed by thousands of subscribers.

AUCTIONEERS' ADJECTIVES.

A QUESTION of interest is as to how far the use of laudatory epithets can safely be carried by auctioneers, and on this point Mr. W. F. Webster, barrister-at-law, threw some light on Wednesday night in the course of a paper on "Particulars and Conditions of Sale," read before the members of the Auctioneers' Institute. Custom, it was admitted, had sanctioned a great deal of laxity. Thus it came about that the distance of a house from a railway-station was generally undertimed. A mean house, with rooms not big enough to swing a cat in, was described as "commodious," or its disadvantages veiled under the ambiguous description "convenient." The words "tasteful," "attractive," "respectable," and above all, "eligible," were worked very hard. The law allowed these trifling deviations from the truth which custom had sanctioned. The theory was that praise conferred by the vendor, and the vendor's estimate of the value of his own property, did not influence, or, at all events, ought not to influence, the purchaser's judgment, and that even if they were unfounded the purchaser had suffered no wrong, because he relied on his own opinion, or accepted the vendor's opinion at his own risk. So long as the vendor indulged in mere laudatory epithets or expressions of opinion, and avoided the use of words which amounted to a statement of fact, he was safe. It was, however, not always

easy to say whether a given statement was merely an expression of opinion or involved a statement of fact. "Substantial and convenient" was allowed to pass in the case of a house one of the external walls of which was only half a brick thick, and the walls of which had slight cracks in them. But "substantial and well-built" was considered a misstatement of fact where the buildings were seriously defective.

Mr. H. Griffin, in the course of the discussion, expressed the opinion that if the auctioneer wanted to be florid he should confine himself to the posters.

Mr. W. R. Johnson, referring to the excessive employment of adjectives, instanced a case in which a builder's villa was described as a "grand and exceptionally unique residence."

EXPANDED STEEL AND CONCRETE.

THE many important and useful applications of expanded steel in armoured concrete and plaster construction for structural and fire-resisting purposes are well known to our professional readers; and the interesting volume issued by "The New Expanded Metal Company, Ltd.," of York Mansion, York-street, Westminster, will be welcomed as a valuable epitome of the system, and as illustrating a large number of structures for which it has been employed. An interesting historical sketch of concrete construction precedes the descriptive account of the expanded metal system. The "Monier" system, invented in Paris in 1876 by Jean Monier, was one of the first systems which combined the compressive strength of concrete with steel in tension. The light steel members of this system were used in this manner, and with remarkable results; but the rods must be latticed together and wired at their intersections. The expanded metal so largely employed of late years in construction seems all that can be desired. A sheet of the "expanded metal" lying on a flat surface touches at only one point in each mesh, and the concrete gives rigidity and strength to the combination by working in and through the metal mesh, so that the latter becomes completely embedded in the concrete on the lower surface of the floor slab or beam. The meshes hold so firmly to the concrete that the steel will break before it can be pulled out; it is therefore far stronger than the rod system. A perfect bond is secured by making the metal sheets overlap one mesh. Two sections are illustrated, which show the relative strength of concrete slabs 6ft. long, one having a sheet of 3in. No. 10 expanded steel, and the other without reinforcement. The first is 3in. thick, and the latter a slab 12in. thick of concrete. Between the two thicknesses is the economic limit for the majority of cases. The expanded metal, though in mesh form, is practically a solid sheet, and, employed at the bottom of the slab, takes all the tensile stress. The tables given of tests are instructive, and show the great strength of this reinforcement. A useful report by Messrs. Fowler and Baker is reprinted, on experiments to ascertain the effect of using "expanded metal" in combination with concrete for flooring. The results of the tests are tabulated, and the summary of them shows (1) that in the case of the 3ft. 6in. span the expanded metal increases the strength of a flat concrete slab from six to eight times the strength for carrying a uniform load, and in the case of the 6ft. 6in. span the strength is increased to ten and eleven times; (2) when made with a greater proportion of cement without expanded metal, the slabs did not approach those made with it, and even with neat cement the strength was much inferior; (3) a concrete slab made with expanded metal gave higher results of strength than a concrete arch of the same span and minimum thickness at crown. Other conclusions are stated, proving the advantages of the combination, to which we must refer our readers, and the reports of tests by Messrs. Idris and Co., Ltd., and Mr. James Mansergh on slabs with and without the expanded metal are confirmatory of the general conclusions. The rest of the volume contains papers by Mr. A. T. Walmisley, M.I.C.E., on the use of expanded metal, mathematically heated, directions for its use, the channel arch floor showing several applications for floors of warehouses, factories, &c. The volume is handsomely got up and illustrated, and should find its place in the office library of every architect and engineer.

The American Lorain Steel Co. has secured the contract for the Wolverhampton electric tramways.

OBITUARY.

MR. JAMES HIBBERT, formerly an architect having an extensive practice at Preston, and a leading member of the town council of that borough, died on the 19th inst., at his residence, Ashby Folville, Anerley, S.E., in his 71st year. Mr. Hibbert's chief work was the Harris Free Library and Museum at Preston, a large Classic edifice erected in 1885-6, of which he was not only the architect, but the deviser of the scheme. He was for years an Alderman of Preston, and served as Mayor. The interment took place at Preston.

CHIPS.

At the last meeting of the Sunderland Corporation, the markets and baths committee reported that, as instructed by the council, they had further considered the question of the erection of new baths and washhouses in Hendon-road, and they recommended that the buildings be erected by workmen employed by the council under the superintendence of the borough surveyor, at an estimated cost of £9,500. The recommendation was adopted after a long discussion.

The Littlehampton Urban District Council have accepted Mr. Carnegie's offer of £2,500 for a free library. The council's surveyor, Mr. H. Howard, has been instructed to prepare designs for the carrying-out of this work.

The Report of the Metropolitan Wesleyan Chapel Committee states that five new buildings are in actual progress, involving an estimated expenditure of £160,000. Five other churches are about to be commenced, that at Upper Tooting costing £16,000. Two large mission-halls are to be built, that at Stepney costing £16,000; also one at Plumstead, at an outlay of £14,000. Other new Wesleyan churches are to follow almost immediately at Highgate, Acton, Lower Sydenham, and Sutton.

The borough surveyor of Blackpool, Mr. Brodie, reports that the section of the widened promenade from South Shore has cost so far £42,096, and the Central Pier portion £12,326.

Large premises between Ferndale-road and the Chatham and Brighton Railway Companies' lines at Brixton, which proved a financial failure as a polytechnic and as public baths, have been acquired by the London County Council, who have practically rebuilt them, and will open them as a technical institute in January next.

The proposal of the Salford Corporation to build workmen's dwellings on land in Seaford-road, Pendleton, was the subject of a Local Government Board inquiry held in the town-hall, Salford, by Major C. E. Norton. The application of the corporation was for sanction to borrow £47,737 under the Housing of the Working Classes Act, 1890, for the purchase of the site and the erection of houses. The plans were shown and explained by Mr. Corbett, the borough engineer. There was some opposition to the scheme on the ground that the houses proposed to be built would be of a better class than could be paid for by the people who are compelled to seek new homes through the demolition of inferior property.

A new pavilion for fever cases, which has been erected at the Brighton Sanatorium by the corporation, was opened the other day by the mayor of Brighton. Mr. Francis J. C. May, borough surveyor, is the architect of the building.

The town council of Shrewsbury have raised the salary of Mr. Johnston, their electrical engineer, from £300 to £350 a year.

The opening ceremony in connection with the new Wesleyan Sunday-school which has been erected at Halebank, Liverpool, took place last week. The new schools, which have a front of Ruabon brick and terracotta ornamentation, provide accommodation for 200 scholars, and are furnished in pitchpine. The cost has been £970.

In the application for discharge from bankruptcy on behalf of David Osborn, builder and contractor, Berkhamsted, Hertfordshire, the order of discharge has been suspended for two years ending Oct. 14, 1905.

A stained-glass window, subscribed for by the past and present nurses of the Staffordshire Institution for Nurses to the memory of the late Miss Mary Shirley, has been erected in St. Barnabas Church, Stoke-on-Trent. The subject is Mary seated at the feet of Jesus.

The restoration of the chancel of Northorpe Church, near Gainsborough, is complete, and two new stained-glass windows have been put in. The subject of the east window is the Transfiguration, and in the south window the figures are shown of St. Andrew, St. Mary the blessed Virgin, and St. Elizabeth. There have also been added a new oak altar and choir stalls, which have been given by the Ecclesiastical Commissioners, and are the works of Messrs. Bowman and Sons, of Stamford.

Building Intelligence.

AXBRIDGE.—A new workhouse infirmary has been opened by the Right Hon. Walter Long, M.P., the President of the Local Government Board. Mr. A. Powell, engineer to the guardians, prepared the plans, and the builder was Mr. Charles Addicott, of Weston-super-Mare, whose tender was accepted at the sum of £5,340. The infirmary is of two stories, constructed of mountain limestone, with Bath stone dressings, and tiled with Bridgwater interlocking tiles. The building is in two distinct parts, the east side for the men and the west for the women, and consists of bed accommodation for 72 people. On the ground floor are two main wards having twelve beds each, and being 36ft. long and 24ft. wide, with lavatory accommodation adjoining, and there are also four separation wards with separate lavatory accommodation, and also two smaller separation wards, and the nurses' kitchen. Day-room accommodation is provided in two rooms facing the south, with bay windows, and there are two bath-rooms. The first floor is similar to the ground floor, with the exception that on the women's side the two separation wards will be utilised as lying-in wards. Hot-water pipes and coils are laid on throughout the whole of the building. Verandahs have been constructed 7ft. wide on the south side of the building. The whole of the building is lit by electric light. The total cost of land, construction of building, heating, lighting, and other contingent expenses comes to a little under £100 per bed.

BECKENHAM, KENT.—The Archbishop of Canterbury visited Beckenham on Saturday, and dedicated the new tower of the parish church, a peal of bells, and a clock. The tower has been designed to harmonise with the main building, in the style of the Late Decorated period. It is built of Kentish rag and stone. The church itself, begun in 1885, accommodates nearly 1,100 worshippers, and has cost altogether over £28,000. The old church, existing until 1884, seated less than 400 persons, and was described as the "smallest and most inconvenient in the parish." Six of the original bells have been recast, and two others added are, with the clock, the gift of Mr. C. E. Atkinson. Two stained glass windows, the work of Messrs. Heaton, Butler, and Bayne, of Garrick-street, W.C., have been placed in the west porch. The contractors for the new tower are Messrs. William G. Bartleet and Sons, of New Broad-street, E.C.

BIRMINGHAM.—The Education Committee of the City Council have received tenders for the erection of a new school in Oldknow-road, Victoria Park, in accordance with the plans approved by the late School Board and Board of Education. The building has been planned on the ground-floor system, with three separate departments for boys, girls, and infants, the classrooms, to accommodate fifty children in each, being ranged round each of the large central halls. The central halls will be used for drill and assembling purposes only, and are not counted in the accommodation. The total accommodation of the school is for 1,070 children—viz., 350 boys, 350 girls, and 370 infants. A caretaker's house is included, and also a manual instruction centre which will serve the requirements of a number of schools in the district. The committee have accepted the tender of Mr. John Webb, amounting to £18,799, for the erection of the buildings.

DEPTFORD, S.E.—Carrington House, on the Mill-lane area, Deptford, was opened by the Countess Carrington on Saturday afternoon. It replaces some slum property acquired by the London County Council, and is six stories in height, with red brick with Portland stone dressings. It contains 814 cubicles, with accommodation for 302 lodgers and 12 porters. Adjoining are Sylva Cottages, also built for the London County Council, and housing 144 persons. The scheme for the improvement of the Mill-lane area was prepared by Mr. W. A. Blaxland, the Council's solicitor, and the acquisition of the property was carried out by the Council's valuer, Mr. Andrew Young. Mr. W. E. Riley, F.R.I.B.A., the Council's superintending architect, prepared the whole of the plans of Carrington House and of Sylva Cottages, and the buildings have been erected under his supervision. The principal part of the furniture has also been designed under his direction. Throughout the preparation of the plans of Carrington House the

Council had the advantage of the advice and assistance of the late Lord Rowton. The works in connection with the widening of Mill-lane were carried out, under the supervision of Sir Alexander Binnie, at that time the Council's engineer, by the then manager of works, Mr. W. Adams. The lodging-house has been erected by the Council's present manager of works, Mr. G. W. Humphreys, and the contract for building *Sylva Jottsages* was taken by Mr. H. L. Holloway, at £4,767. The gross outlay on the clearance has been £22,806, and the net cost to the ratepayers will be £8,631. The electrical work has been carried out under the direction of Mr. M. Fitzmaurice, C.M.G., the Council's engineer.

FISHPONDS, BRISTOL.—The foundation-stone of the new wing of the Diocesan Training College, Fishponds, was laid on Thursday in last week by the Bishop of Bristol. The annexe will form a south wing to the college, with a length of 125ft., and a width of 45ft., connected with the main building by a covered cloister 52ft. long. It will consist of two lecture rooms, 37ft. by 27ft., two sitting-rooms, and dormitories to accommodate twenty-six students, and two governesses' rooms. The design throughout will be in strict keeping with the Gothic style carried out in the already existing college buildings, which were erected in 1854 at a cost of £12,000. The estimated cost of the wing is £4,340, exclusive of furnishing. The work is being carried out by Mr. C. A. Hayes, building contractor, Thomas-street, Bristol, from designs supplied by Mr. W. V. Gough, architect, also of Bristol.

GREAT YARMOUTH.—On Wednesday week the new chimney of Yarmouth Corporation electric works had a christening ceremony. The mayor and a number of members of the corporation assembled at the chimney, and were entertained to champagne by the contractors, Messrs. Carter and Wright. The municipal visitors were hoisted by a lift which has been used during the construction of the chimney to the top. The chimney was erected under contract with the corporation, from plans prepared by the borough surveyor. The foundations were taken down 7ft. below the ground. There a bed of concrete, 40ft. square and 6ft. in depth, was put in at one time by relays of men following each other, which involved handling 500 tons of material, being completed in forty-eight hours. The chimney is 175ft. in height, and its weight above ground 2,400 tons. The internal size at the apex is 9½ft. square, and at the base 23ft. Its duty will ultimately be to provide draught for boilers of 3,000H.P. The destructor chimney at Yarmouth, it may be mentioned for purposes of comparison, is 200ft. in height, but has an internal diameter at its summit of over 6ft. The new shaft is built square, of red brick, and from 6ft. in thickness at the base the sides taper off. The work has been carried out under the supervision of the borough surveyor, and the assistant on his staff responsible for the construction was Mr. Leeper.

IPSWICH.—The new electricity generating station in Constantine-road, Ipswich, was formally opened by the mayoress on Saturday, and at the same time the tramways, which have been acquired by the corporation from a private company, converted from horse to electric traction, and greatly extended, were inaugurated. The urgently-needed street improvements, carried out simultaneously with these works, have cost the borough £80,000. Mr. C. Stanley Peach, F.R.I.B.A., of London, was the architect, and the consulting electrical engineer has been Dr. Alexander W. B. Kennedy. The contractors for the tramways and equipment were the British Westinghouse Company and Messrs. Dick, Kerr, and Co., the latter being represented by Mr. Macintosh as resident engineer. The generating station, work-shop, car-shed, and offices have been built by Mr. S. A. Kenney, of Ipswich, the amount of his contract being £26,948 for the generating station and offices, and £6,704 for car-shed. The buildings include an engine-room, with a 10ft. basement. Attached to it are battery-room, boiler-house, workshop, economiser building, and car-shed. The offices are on the ground floor. On the first floor is the switch-board gallery, engineering charge office, work-shop, motor-room, drawing-office, &c. Mr. Cecil C. King was the resident architect, and Mr. James Yarrow has acted as clerk of the works on behalf of the corporation. The refuse destructor, which is also located on the site, cost £3,695. The other expenses, including half the

cost of the chimney shaft, brought the total to £12,000. The destructor has been put in, and the destructor buildings and the shaft have been erected by Mr. Shillitoe, of Bury St. Edmunds, whose contract price was £5,500. The shaft at the bottom outside is 21ft. 6in. across, and the walls are 3ft. thick. It is 178½ft. high, and is 12ft. square inside at the top. The destructor buildings are of brick and corrugated iron.

LEEDS.—The new dispensary in North-street is rapidly nearing completion, only the fittings requiring now to be fixed. The architects are Messrs. Bedford and Kitson, of Leeds. The plainness of the building's exterior has been relieved by a cartouche consisting of two figures of cherubs, placed over the principal entrance in North-street, and a seated figure representing Charity over the doorway leading to the out-patients' department in Hartley Mill. These figures have been executed by Mr. H. C. Fehr. The site, which covers over a quarter of an acre, has been purchased at a cost of £10,000, and the building will cost another £18,000. Small Accrington brick has been used in the facings, with dressings of Portland stone. The residential part faces North-street, and occupies the first and second floors, with kitchens and servants' rooms above, while the ground-floor of the North-street front is occupied by the board-room, secretary's office, &c. Behind this is an out-patients' waiting-hall, 90ft. by 30ft. On either side of this are the surgical, medical, and ophthalmic consulting and examination rooms. Provision has been made on the floor above for the chemical laboratory and for a dental department.

LONDON COUNTY COUNCIL.—At the weekly meeting of this body on Tuesday, a discussion arose on a recommendation of the Highways Committee that the erection of the superstructure of the car-sheds for the New-cross and Greenwich trams should be executed by the Works Department without the intervention of a contractor. The architect's estimate of the cost, including £3,500 for clerk of works salary and architectural and other expenses, was £84,030. The recommendation was eventually adopted, a motion in favour of advertising for tenders being defeated. On the recommendation of the Housing of the Working Classes Committee the tender of Messrs. Kirk and Randall, of Woolwich, for £17,884 was accepted for the erection of Valette-buildings, Jerusalem-square, Hackney. These buildings are required for the accommodation of persons of the working classes displaced by the Mare-street, Hackney, improvement. The architect's estimate for this work was £18,978. The building will consist of one block of five-story dwellings, and will provide accommodation for 416 persons, in 39 tenements of two rooms, 34 tenements of three rooms, and seven tenements of four rooms.

NEWCASTLE-ON-TYNE.—A report on the proposed extensions (with nurses' home) at the City Hospital for Infectious Diseases, Walker Gate, has been issued by Mr. F. H. Holford, city property surveyor, to members of the Newcastle City Council. The accommodation required, and for which plans have been prepared, includes two new pavilions, containing two wards, with ten beds in each, six private wards of one bed each, also additions to the present isolation block, with two new double-bedded wards, and the two present nurses' duty rooms are to be converted into wards. It is further proposed to convert present nurses' duty rooms in four pavilions into wards of one bed each. The total additional number of beds in the pavilions, isolation block, receiving rooms, &c., will be 74. It is also proposed to erect a nurses' home to the north of the hospital. The estimated cost of the whole of the projected works is £33,528. With regard to the smallpox hospital on the Town Moor, the additions and alterations to the old building are practically completed. The cost of the work has been £3,846 13s. 2d.

ROTTERHAM.—The new Wesleyan church in Talbot-lane was recently opened. It replaces a chapel, Classic in character, destroyed by fire on November 15, 1901. The style of the new church is Decorated Gothic, and the tower and spire rise to a height of 130ft. There is also a smaller tower at the rear of the building. The church itself consists of nave, transepts, and chancel, and will accommodate 860 worshippers, 500 being on the ground floor and 360 in the gallery, which runs round three sides of the building. There are vestries for the minister and the choir on the ground floor, and a chamber is provided for the organ. Full advantage has been taken of the

sloping nature of the ground, and a church parLOUR, 36ft. by 22ft., has been arranged below the chancel, and on this level also are the kitchen, two classrooms, and a storeroom. The tracery windows throughout are filled with tinted leaded lights, carried out by Mr. T. W. Camm, of Smethwick, Birmingham, and the three chancel windows are filled with stained glass by Mr. S. Evans, of Birmingham. The heating is by low-pressure hot-water apparatus supplied by Wright Bros., Sheffield. The whole building is faced with stone. The contract has been carried out by Mr. Robert Snell, of Masbro', from the designs and under the supervision of Messrs. W. J. Morley, F.R.I.B.A., and Son, architects, Bradford, the whole cost being £10,000, exclusive of organ.

SOUTHAMPTON.—The Bishop of Winchester has consecrated the new church of St. Barnabas, Lodge-road. The church, which is of dressed stone, and replaces an iron building, is of Gothic design, and has been erected at a total cost, including fittings, furnishing fees, fencing, and all expenses, of £7,100. The seating of oak pews provides accommodation for 624 persons, and 150 chairs can be utilised as occasion requires. Messrs. Mitchell, Son, and Gutteridge, of Southampton, were the architects, and Messrs. Jenkins and Sons, of the same town, the builders.

STOCKWELL, S.E.—The Bishop of Rochester laid, on Tuesday, the foundation-stone of the first of a number of residential clubs for young business men which it is intended to establish in different parts of London under the name of "Ingram Houses." The building is to be at Stockwell, where a site has been acquired at a cost of £10,826. The Stockwell-road house will include four floors of bedrooms, a suite of club-rooms on the ground floor, and a large basement containing other club-rooms, as well as the service of the building. Accommodation will be provided for 208 residents, each of whom will have a separate room, not less than 7ft. by 10ft., and the use of the club-rooms in common. The rent, which will also include service, will range from 7s. to 12s. a week per bedroom. The club-rooms on the ground floor include a dining-hall, a smoking-room, a library, and a billiard-room for three tables. There are to be, in addition, in the basement a lecture-hall, to be fitted as a gymnasium, and a second billiard-room, also containing three tables. The estimated cost of the building, including furnishing, is £36,000, and it is hoped that the work will be completed in May, 1905. Mr. Arthur T. Bolton, of Victoria Mansions, Westminster, architect to the company, has designed the house, and the contractors are Messrs. Rudd and Son, of Grantham.

SHREWSBURY.—The headquarters of the Shropshire Constabulary have now been removed from the Square to new buildings on Swan-hill, also in Shrewsbury. Built of Ruabon bricks, with Grinshill stone dressings, the premises are fitted with wrought-iron window frames. On the ground floor are an occasional court and the orderly clerk's room, with observation windows into the main hall. On the other side of the hall is a charge and parade room, and beyond this a corridor leading to the cells, which are lined with white glazed bricks. The staircase, with substantial oak railings, leads to the chief constable's office, the office of the chief clerk, and the pay clerk's office, stationery storeroom, and to a constables' room. At the rear is a superintendent's house. In the parade yard at the back are a motor and cycle house and stabling. Fire hydrants have been placed in different parts, while the artificial lighting is supplied by electricity. The work has been carried out by Mr. T. Pace, Shrewsbury, to the plans of the county surveyor, Mr. A. T. Davis, M.I.C.E. The expenditure has been £6,000.

TOYNTON.—The church of Toynton All Saints, in the deanery of Bolingbroke, Lincs, which is now under repair and restoration, has been found to contain a Late 13th-century arcade in the south wall and a Norman arcade in the north wall. These were not discovered till the plaster was removed. The north arcade, which is much damaged by fire, is in a weak state, and needs underpinning; but the bishop, the rural dean, and the rector are of opinion that it would be a great pity that the arcades should be built up again for lack of funds. To display them will add £250 to the cost of restoration. The architect is Mr. Harold Bailey, of Newark-on-Trent. It may be added that the south arcade consists of four bays. There are two limestone pillars,

octagonal in shape, but standing on square bases. Three of the arches are perfect, but one has at some time been cut away to make room for a window to give light to the west gallery. The Norman arcade has five bays of about 9ft. each. The pillars are round, with carved capitals. The two arches which have so far been cleared show traces of the Norman custom of coating sandstone with plaster and then painting the plaster. When the arches were built up in the 14th or 15th century the brickwork was plastered and the plaster adorned with ornamental lettering.

WAKEFIELD CATHEDRAL.—A meeting of the joint committees of the Walsham How Memorial Fund for the enlargement of the Wakefield Cathedral was recently held at Wakefield. The Bishop of Wakefield presided. Sub-committees were appointed to deal with the heating and lighting of the edifice, and the engineer gave particulars of the scheme and exhibited plans. Drawings of the base of the tomb were shown to the meeting, and were referred to the sub-committees for consideration. The bi-hop and the archdeacon reported as to the altar-screen, and stated that Colonel Clapham, of Manchester, had consented to provide new wings to the reredos. The clerk of the works gave his report, which showed that the work of the extensions was progressing very satisfactorily.

CHIPS.

Dr. Tristram, K.C., the Chancellor for the diocese of London, has granted a faculty to the vicar and churchwardens of St. Columba's, Haggerston, first for making a new and more convenient entrance to the parish church, and, secondly, for erecting a mortuary chapel in a cloister to be constructed by the side of the church.

Mr. W. O. E. Meade King, a Local Government Board inspector, has held an inquiry at Redruth, respecting the application of the urban district council to borrow £6,750 for work of sewerage and sewage disposal, including works to be erected beyond the limits of the districts—viz., in the parish of Illogan and land within the jurisdiction of Redruth Rural Council. The scheme includes the conveyance of drainages through pipes from Redruth's present outfall to Portreath, and the carrying it out to sea by tunnelling through the cliff.

The fish market at Aberdeen, the largest in Scotland, has been further extended by the addition of a covered floor space 600ft. in length and 50ft. in width, and a 10ft. wide wharf along its entire length. The old platform showed a depth of only 8ft. at low water, but the new wharf indicates 15ft. at ebb tide. The total cost of the wharf and works is about £15,000.

The Local Government Board have intimated their willingness to consent to the application for £13,000 to be borrowed from the Board of Works by the Strabane Urban District Council for the erection of new gasworks. Mr. Charles Hunt, of Westminster, is the engineer.

The Corporation of Wolverhampton have issued notice of their intention in the ensuing session to apply to Parliament for an Act to enable them to do a variety of things. They intend to ask for powers to construct tramways into Heath Town and Wednesfield; reconstruct, widen, and improve a bridge over the canal at Wednesfield; erect new buildings, supply electricity, and deal with markets, streets, sewers, drains, sanitary provisions, common lodging-houses, and the borrowing of money.

A memorial window of stained glass, executed by Mr. S. Caldwell, of Canterbury, has been placed in the chapel of Walsingham Workhouse. It is placed in the east end of the chapel. The centre light represents the ascension of our Lord, whilst on either side the subjects are Christ blessing little children, and the anointing of Christ by Mary.

The Preston Town Council have decided to promote a Bill in Parliament to enable the Corporation to undertake extensions of the existing waterworks, which it is estimated will cost between £150,000 and £200,000, and which will meet the needs of the town for the next twenty years.

A Hammersmith bootmaker, who claimed £1,654 from the London United Tramways Company for damage suffered by him in his business through the forcible acquisition of the forecourt of his shop, has been awarded £557 in the Sheriff's Court.

The partnership hitherto existing between II. Spurrell and W. H. Murray, architects and surveyors, Eastbourne, under the style of Spurrell and Murray, has been dissolved.

A Bill has been introduced into the Legislative Council of the Viceroy of India by Sir Denzil Ibbetson for the purpose of giving Government powers for the preservation of privately-owned ancient monuments.

LEGAL INTELLIGENCE.

IN RE LIGHTBOUND, RIGBY, and Co.—At the Liverpool Bankruptcy Court on Friday, Charles Latham and Ralph Norbury, who had traded as timber merchants, under the style of Lightbound, Rigby, and Co., appeared for public examination. The joint statement of affairs shows liabilities expected to rank of £78,761, and assets of £80,143, giving an apparent surplus. The bulk of the assets, however, are locked up in a building scheme at Oak-hill Park, the realisation of which has yet to be undertaken. Replying to the Official Receiver, Mr. Latham related the history of his firm. It began in 1888, to some extent on borrowed capital. In March, 1893, a statement prepared showed the profits for the five years had been £4,388. In June, 1900, another statement showed that for those seven years the profits were £16,174; but the joint drawings of the partners in that period were more than double. The bankrupt admitted having lived beyond his means. The position of the firm was largely ascribed to the building scheme. Accommodation bill transactions were admitted to have extended over three or four years. An adjournment to December 3 was taken.

IN RE W. H. WATERMAN, ARCHITECT.—The receiving order in this case was made upon a creditor's petition, the debtor, William Henry Waterman, being described as of 7, Cullum-street, E.C. The statutory meeting was held last week before Mr. Walter Boyle, Assistant Receiver. It appeared from the debtor's statements that he had previously failed in 1894, but the receiving order was rescinded on the payment of a composition. Shortly after the failure he started business as an architect, at 7, Cullum-street, with a borrowed capital of £250, which he had since repaid. For some time he carried on the business in partnership with another person, but a dissolution was arrived at in 1899. About a year later another person, who introduced a capital of £1,500, joined the debtor in partnership, and they had since carried on the business. The debtor attributed his failure to costs of litigation, to bad debts, and to other causes. He stated that his insolvency was also partly due to loss on the sale of horses, which he had bought and sold more for a hobby than for a business. The chairman reported that a rough statement of affairs had been lodged showing liabilities £4,689 5s. 5d., of which £3,049 15s. 5d. was unsecured; and assets valued at £1,392. Mr. W. Morley attended the meeting on the debtor's behalf, but submitted no proposal. A resolution for bankruptcy was accordingly passed, and an accountant was nominated as the trustee to wind up the estate. The public examination is fixed for December 15.

A MILLBANK ARBITRATION: REINSTATEMENT AS A BASIS OF COMPENSATION.—Mr. John Troutbeck, High Bailiff for Westminster, and a special jury, heard, on Thursday, Friday, and Monday, the case in which Messrs. Vacher and Sons, Parliamentary printers, of Great Smith-street, Westminster, claimed from the London County Council £25,600 as compensation for the compulsory acquisition of their leasehold interest in the premises, 20 and 22, Millbank-street, Westminster, required by the Council in connection with the improvement of that thoroughfare. The claimants' case was based on the principle of reinstatement, they having erected large premises in Great Smith-street at a cost of £27,000, incurring an extra rental, over and above the £500 paid for the old premises, of £1,619 per annum. On this sum they claimed ten years' purchase, and the other items included: Value of machinery, £3,849; two years' net profits, £4,700; and removal of stock, £500. Expert evidence in support of these figures was given by Mr. Tewson, Mr. Trollope, and Mr. John Eason. Sir Edward Clarke described the claim as an extravagant one, and said the County Council refused to recognise it on the basis of reinstatement. For the County Council, Mr. Samuel Walker stated that the utmost the claimants were entitled to was £4,364. He could have housed them in a nearer and more suitable building for £5,000. Mr. Howard Martin, another surveyor, said he thought £4,043 would amply compensate the claimants. The High Bailiff said that unless the jury thought the ordinary mode of compensation would do the claimants an injustice, they ought not, in his opinion, to adopt the basis of reinstatement. It was a very serious and important case, as the adoption of the principle of reinstatement might create a prohibitive cost of carrying out public improvements. The jury awarded the claimants £8,413.

CLAIM BY AN ARCHITECT.—At the Binger County-court last week, before Sir Horatio Lloyd, Mr. R. G. Thomas, architect and surveyor, Menai Bridge, brought an action against Mr. J. Harold Hope, of Penmon Park Quarries, Anglesey, to recover £34 13s. for professional services rendered in viewing land at the quarries, preparing plans and tracings of a house and office at Penmon, examining plans and quantities, and assisting the quarry manager in pricing for a contract for the Grand Hotel, Llandudno, and the same with the sea wall and promenade at Penmaenmawr. Mr. Ellis J.

Griffith, M.P., appeared for the plaintiff, Mr. J. Bryn Roberts, M.P., being for the defendant. The case had been transferred from the High Court. The defendant had paid £15 into court, contending that that was sufficient to meet the work done. After hearing the evidence, his Honour gave judgment for plaintiff for 20 guineas and costs.

IN RE G. R. H. WALES.—An adjourned sitting has been held for the public examination of G. R. H. Wales, builder, of Cassland-road, South Hackney, N.E. The statement of affairs showed gross liabilities amounting to £33,762 5s. 11d., ranking liabilities £5,372 8s., and an estimated surplus of assets. The debtor had been engaged in building operations at Acton, Hackney, Harlesden, Obiswick, Shepherd's Bush, and Willesden, and attributed his bankruptcy to pressure by creditors and inability to realise certain property at Acton. The examination was concluded.

IN RE H. J. CAVE.—A sitting was held last week for the public examination of Mr. Harry Jarvis Cave, builder, of Lauderdale Mansions, Lauderdale-road, Maida Vale, W. The gross liabilities were returned at £126,831 15s. 10d., of which £8,684 15s. 13d. was unsecured, and the assets were estimated by the debtor to produce £34,760 19s., consisting almost entirely of an estimated surplus expected to be realised from securities held by creditors treated as fully secured. It appeared from the debtor's statement that he began business as a speculative builder ten years ago, when he was twenty-one years of age, and had very little capital. He had since been engaged in the erection of buildings at Clapham, Willesden-lane, Haverstock Hill, and Maida Vale. His failure was partly due to his inability to let many of the flats which he built in Lauderdale-road, Maida Vale; also to the payment of heavy interest, and inability to obtain adequate loans on permanent mortgages of his properties. His statement of affairs showed an estimated surplus of £25,000, but he did not think so large a surplus would be realised. During the past three years his expenditure had amounted to £9,471 18s. 2d. The examination was concluded.

IN RE JOHN NELSON, OF YORK.—John Nelson, of York, who formerly carried on business on a large scale as a contractor and brickmaker in that city, recently applied to Judge Topley, sitting at the York County-court, for discharge from bankruptcy. The Official Receiver reported that the receiving order was made in December, 1901. Bankrupt's estimate of liabilities to rank for dividend was £10,123, but the proofs actually admitted amounted to £12,619. The unassigned assets were estimated to produce £13,935, but had only realised £2,614, this difference being accounted for mainly by the forfeiture to the North-Eastern Railway Company of the retention money due under the contract, the price of work done, and the plant on the works, in pursuance of the terms of agreement entered into with the bankrupt. A first and final dividend of 3s. in the pound was paid on proofs for £12,619. The cause of bankruptcy was the disastrous result of the contract entered into by the debtor with the North-Eastern Railway Company for the making and deviation of a railway at Dunston, near Newcastle-on-Tyne, for £32,000. Soon after the work was begun it was found, owing to the nature of the subsoil, to be almost impossible to get a solid foundation. All the debtor's capital seemed to have been expended in the work, as well as £18,000 received on account from the company. It was alleged that the person who took the job, immediately following Mr. Nelson, died as a result of it, and the thing is still unfinished. The discharge was granted, subject to suspension for two years.

A LEITH ARBITRATION.—Mr. Charles J. Guthrie, K.C., as the oversman in the reference between the trustees of the late Mr. John M'Farlane, of Bundermere, and the Caledonian Railway Company as to the value of the property belonging to Mr. M'Farlane in Leith Walk, has now issued his proposed findings. The company took the ground for the purposes of their new railway. Having inspected the ground acquired and taken evidence of the averments of parties and heard them thereon, the oversman finds that the value of the subjects to the claimants as at the date of the company's notice to treat was £1,531, and that the claimants are entitled to this sum, with 10 per cent. added, making £1,684 2s., with interest at 5 per cent. from May 15, 1903. At the hearing the claimants claimed an award of £6,500, while the company maintained that the award should be about £1,000, exclusive of the usual 10 per cent. for compulsory purchase. Mr. Jameson, K.C., was nominated as arbiter by the claimants, while the company nominated Mr. James Watt, W.S.

The Worshipful Company of Plumbers give notice that they will, upon application, register the names of apprentices free of cost. Apprentices who pass the final examination are eligible to receive the Certificate of Registration under the National Registration of Plumbers.

HEYWOOD FREE LIBRARY.

This design, by Messrs. North and Robin, of 203, Strand, London, was placed first in the recent open competition, Mr. Duncan (of Messrs. Butterworth and Duncan) being the assessor. It is proposed that the main front be executed in stone and the flanks in stone and brick, the roofs being covered with green Westmoreland slates.

DISTRICT OFFICES, HAMILTON.

This illustration shows the committee-room included in the suite of offices for the Middle Ward District of the County of Lanark, the staircase and central hall of which were published on Sept. 25 last. The architect is Mr. Alex. Cullen, Brandon Chambers, Hamilton.

NATIONAL BRONZE MEDAL DESIGN FOR BOOK ILLUSTRATION.

This composition is simply a decorative treatment of landscape combined with an architectural ideal in strong line work, drawn with a view to reproduction and reduced scale. Otherwise it explains itself. The author is Mr. Edward R. Clarke, of Scarborough, who was awarded a bronze medal this year, the judges remarking upon his "vivid impressions from nature, which are united with a bold and effective convention which make his work highly decorative."

CHAPEL AND SCHOOLS, JARVIS BROOK, SUSSEX.

This building is proposed to be built of stone from the local quarries, with oak half-timbering, roof covered with tiles, and tower roof with oak shingles. The accommodation of the church on the ground floor is for 266, and for 55 in the small gallery at north end. The school comprises large hall and classrooms, with kitchen, &c., and, in addition, are planned as schools for Sunday, and lecture-hall and recreation rooms on work-days. The estimated cost is £3,500. The promoters of the scheme are desirous that the building should express what it is intended for—viz., a country church and school. The architect is Mr. Wm. C. F. Gillam, M.S.A., of Brighton.

BANK OF NEW SOUTH WALES, INVERCARGILL, NEW ZEALAND.

The bank premises on the ground floor comprise a banking chamber, 25ft. high, manager's room, strong room; telephone, typewriting, and stationery rooms, and a sitting-room and bedroom for a resident clerk. The remainder of the ground floor is occupied by a shop with office attached, and separate ranges of latrines for the use of the bank staff and the offices are placed in the corner of the site. On the upper floors, which are approached by wide staircases from both streets, are 26 suites of offices for letting, with seven strong rooms, lavatories, &c. Internally

the walls are all plastered, and have dadoes of native red pine with machine-carved mouldings. The ceilings are of stamped steel, those in the principal rooms of elaborate design. That of banking-chamber is deeply coved and richly ornamented. Native figured red pine is used for the banking chamber fittings enriched with carving and dull polished. Externally the walls, which are of brick, are finished with cement plaster, except the plinth, which is of local ocean beach granite. The steps are of white Sicilian marble, and the porches are paved with encaustic tiles. The cost complete is about £7,000. Mr. C. J. Brodrick is the architect.

SEACROFT GOLF LINKS HOTEL.

The Seacroft Golf Links Hotel is proposed to be a red brick building up to the first-floor level, above which it will be roughcast, and with a "modelled" wood cornice, which will be painted white, the roof being covered with hand-made strawberry-coloured tiles. The accommodation provides not only the ordinary hotel accommodation, but also a small golf club, with the necessary dressing-rooms, &c. Messrs. Brewill and Baily, F.F.R.I.B.A., Nottingham, are the architects.

GROUP OF JACOBAN FURNITURE.

Good old solid furniture of this type is always interesting, although in such traditional cabinet-work the ever-varying details of its design do not appear at once so evident as they often really are, and thus the casual observer of such things is under the impression that he has seen all that he need know about them. Neither of the pieces sketched to-day show any leading variation of form from the usual type to which they belong, and yet at the same time each displays those minor differences which are characteristic of work done individually by craftsmen who worked with personal interests in what they were producing, and not with unvarying imitation of some set pattern at so much per thousand, as men labour now.

FINE ANTIQUE SOLID OAK CEILING AND FLOOR, TAUNTON.

This admirably designed oak ceiling of the time of Charles II. is drawn in detail by Mr. C. H. Samson, of the firm of Messrs. Samson and Cottam, architects, of Taunton. The work requires but little description, as it is so clearly shown. The main beams, which run transversely, carry the weight of the whole structure, the intersecting longitudinal ones of the same scantling merely being framed into the end wall plates like the intermediates, which in turn carry the joists laid flatways, with pleasing effect. The piece is for sale by Messrs. Stevens and Co.

CHIPS.

The town council of Helensburgh, N.B., have accepted the tender, amounting to £3,939, of Mr. W. Wilson, Cathcart, for enlarging the upper reservoir to give an additional storage of 20,000,000 gallons, and also to provide a small reservoir, with a storage capacity of 2,000,000 gallons, on a higher level for supplying Upper Helensburgh.

Mr. John Priestman and family, of Sunderland, have given £6,000 towards the establishment of a new parish church for Roker and Fulwell. The ecclesiastical commissioners have given a site and £500 for the edifice. The church, which is to be erected very shortly, will cost £9,000, and a committee is arranging to raise the additional £3,000. A new parish will be formed, called either St. Saviour's or St. Andrew's, Monkwearmouth.

At the last meeting of the Somerset Drainage Commissioners the engineer, Mr. W. Lunn, presented a report and estimate upon works which he considered essential to the safety of the district, to be carried out to the Burnham sea-wall, south of the pier, and the north bank of Highbridge. His estimate showed a total of £2,693 4s. 8d. The finance committee recommended that part of the works be carried out at an estimated cost of £1,243. The recommendation was adopted.

The parish church of Tremaine, Cornwall, has just been reopened after extensive repair. It is a little Norman structure of nave and chancel only, the distance between the walls being only 12ft., and these have pushed outward by the thrust of the 15th-century carved cradle-roof. So dangerous had not only the walls of the church, but the tower also, become that the parish had decided to pull the building down altogether. However, under the supervision of Mr. Edward Sedding, of Plymouth, the walls have been buttressed and underpinned and rendered sound.

COMPETITIONS.

BRIGHTON.—The award in the Brighton Women's Hospital Competition has just been determined, the first prize being taken by Mr. John Denman, a Brighton architect, the premium being £50. The second premium of £30 is given to Mr. E. P. Howard, and the third premium of £20 is divided between Messrs. F. Pennington and J. S. Quilter.

THE PAVIORS' COMPANY AND THE STREET SUBWAY QUESTION.—An exhibition of the designs sent in to the Paviers' Company, in response to an offer of 150 guineas, in three prizes, for the best designs and essays on the subject of street subways, was held on Monday in the Old Council Chamber at the Guildhall. Nearly thirty competitors entered, the competition having been promoted on the initiative of the Master (Major L. H. Isaacs). The judges were the Master, Mr. D. J. Ross (the City engineer), Mr. J. W. Bradley (the City engineer Westminster), and Mr. W. Weaver (the engineer to the borough of Kensington). The prizes were 100 guineas, 30 guineas, and 20 guineas, and the respective winners were as follows:—Mr. R. M. Parkinson, 93, Lincoln-road, Peterborough; Mr. A. J. Price, Urban District Council Office, Lytham; and Mr. F. M. Royal, Third-avenue, Sherwood Rise, Nottingham. Each design was accompanied by an essay. The subway system originated in the City of London, where, however, little had since been done in its extension. In 1901 there were 2,540 lineal yards of subway under the control of the City Corporation, nearly nine miles of pipes, &c., being contained therein. In that year the City engineer reported that the subway in Queen Victoria-street was visited by no fewer than 15,325 workmen for various purposes.

RAWTENSTALL.—The free library committee of the corporation met on Friday to receive the report of the assessors, Messrs. Butterworth and Duncan, of Rochdale, on the competition for proposed free library, town-hall, and assembly-room, on the Queen's Meadow, Rawtenstall. Upon accepting Mr. Andrew Carnegie's promise of £6,000 towards the cost of erecting a free library, the town council advertised a competition for designs, premiums of £100, £50, and £30 being offered for designs. The author of the first design will be appointed architect to erect the library buildings, and be paid in accordance with the R.I.B.A. scale of charges, conditionally on the corporation being satisfied that such design can be satisfactorily carried out, and that the successful competitor has had sufficient practical experience. The corporation does not intend to proceed with the erection of the town-hall and assembly-room, and the successful competitor will have no claim upon the corporation in consequence thereof, nor will he have any claim to be appointed architect should the corporation hereafter proceed with that portion of the work. The whole of the successful drawings will become the absolute property of the corporation on payment of the premiums. The cost of the library building was not to exceed £5,000, including furnishing and everything necessary for the occupation of building, except books. The cost of the town-hall and assembly-room was not to exceed £18,000 and £6,000 respectively, inclusive of heating, lighting, fire appliances, means of ingress and egress, and ventilation. The elevations were to be entirely of local "pitch-faced" stone, with Darley Dale or similar colour of stone dressings. The style of architecture was left to the competitors, but it was suggested that this should be simple rather than ornate in character. Twenty-two designs had, it was reported to the committee, been sent in, and the assessors had had some difficulty, on account of the merits of the respective designs, in awarding the second and third prizes. The successful competitor is design No. 5, sent in by Messrs. Crouch, Butler, and Savage, of Birmingham, whose plan was regarded by the assessors as the best submitted. The second premium was divided between designs No. 3 and 15, which were sent in respectively by Mr. A. T. Butler, of Cradley Heath, and Messrs. Stones and Stones, of Blackburn, acting in conjunction with Mr. W. Edwardes Sproat. The third premium was divided between designs 9 and 13, which were sent in by Mr. E. Jenkin Williams, of Cardiff, in collaboration with Mr. Edgar G. C. Down, A.R.I.B.A., also of Cardiff, and by Mr. Albert E. Dixon, of Leeds. The five premiated designs are on view in the mansion at Whitaker Park during the whole of this week.

PROFESSIONAL AND TRADE SOCIETIES.

BIRMINGHAM MASTER BUILDERS' ASSOCIATION.

—The annual meeting of the members was held recently at the Grand Hotel, Colmore-row, Birmingham, Mr. Albert S. Smith presiding. The annual report expressed regret that the depressed condition of trade referred to twelve months ago has continued during the past year. After again meeting the Operative Plumbers in conciliation, the committee had been unable to come to any satisfactory arrangement as to the code of working rules, the operatives declining to sign for less than three years. There were, therefore, no rules in existence with this branch. In view of the unreasonable demand of the National Association of Operative Plasterers in various parts of the country, the committee had given notice to the Operative Plasterers to abolish all existing rules after April next. With this exception, the committee had, after consideration, decided not to disturb the trade by serving notices for alteration of rules, although the present state of the trade fully justified notices to reduce the existing high rate of wages. On several occasions deputations had interviewed sub-committees of the Architectural Association on matters of importance in the interests of the trade, notably the interpretation of the Prime Cost Clause in the conditions of contracts, and "items of making good after other trades." The balance-sheet showed total ordinary receipts for the year £219, which, with the balance from last year, made a total of £391. The various disbursements amounted to £204, and there remained £187 to the credit of the association. In moving the adoption of the report and balance-sheet the President said that trade last year was bad, and since then it had visibly declined. They could not say that prices were low. Materials had not come down to any great extent. Labour was at the highest point it had ever reached; and so they could not quite say that building prices were low. Mr. William Sapcote seconded the motion, and endorsed what the president had said in reference to the plasterers. The motion was carried unanimously. Lieutenant-Colonel Barnsley was unanimously elected president for the ensuing year, and Mr. J. B. Whitehouse vice-president; Mr. G. Twigg was reappointed treasurer, Messrs. Thomas Johnson and J. S. Surman auditors, and Mr. E. J. Bigwood was re-elected secretary. On the motion of Mr. J. B. Whitehouse, seconded by Mr. C. Copeland, a vote of thanks was passed to Mr. Albert S. Smith for his services during the past year in the position of president. A dinner followed in the Grosvenor Room, and was largely attended. The chair was occupied by Lieutenant-Colonel John Barnsley. After the loyal toasts had been honoured, the toast "The City and Trade of Birmingham" was submitted by Councillor Whittall, who described, from a builder's point of view, the work carried on in some of the departments of the corporation, mentioning in particular the Public Works Department and the Drainage Board. Mr. Ebenezer Parkes, M.P., responded. Mr. Thomas Barnsley proposed "Success to the Birmingham Builders' Association." The toast "The Architects and Surveyors" was proposed by Mr. J. B. Whitehouse, and Mr. Arthur Harrison and Mr. Anthony Rowe responded on behalf of the architects and surveyors respectively. Mr. A. S. Smith, the new president, proposed the toast "National Federation of Building Trade Employers of Great Britain and Ireland." Response came from Alderman John Bower, the ex-president of the National Federation, and Mr. C. H. Barnsley (president of the Midland Federation).

BRISTOL SOCIETY OF ARCHITECTS.—At the opening of the session on Monday last, the president, Mr. Joseph Wood, F.R.I.B.A., entertained the members of the council at dinner, after which a smoking "At Home" was held at the Fine Arts Academy, Clifton. The president's hospitality met with a gratifying response in the presence of a very large gathering of members and architectural assistants and pupils, who inspected with the greatest interest a large collection of admirably-executed sketches and measured drawings, the result of the work of a long period of years by the president and his late partner, Mr. Forster. Many of the sketches dated from the early "forties," and illustrated bits of old Bristol that had now disappeared. After refreshments had been partaken of the president addressed a few words more especially to the student members, impressing upon them

the desirability of maintaining enthusiasm in their studies by sketching and measuring good examples of old and modern work.

THE BRITISH ASSOCIATION OF WATERWORKS ENGINEERS.—The eighth winter meeting, 1903-4, will be held at the Geological Society's rooms, Burlington House, W., on Saturday, December 12, 1903, when the chair will be taken at 11 a.m. Ballots will be taken for the council and officers for 1904-5, and for new members and associates. Balloting papers for council and officers are sent to members entitled to vote; balloting papers for new members and associates will be handed to members on entering the meeting room. Papers will be read, entitled "The Storage of Flood Water," by Professor Henry Robinson, M.I.C.E.; "The New Reservoir for the Hoylake and West Kirby Waterworks," by Alfred J. Jenkins, Assoc.M.Inst.C.E.; and "The Cogan Extensions of the Cardiff Corporation Waterworks," by Neil J. Peters.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.

—The annual meeting of this society took place on the 19th inst. at the Queen's Hotel, Leeds, and was numerously attended. In his third presidential address, Mr. Butler Wilson, F.R.I.B.A., referred in terms of praise to City-square. By the munificence of Colonel Harding and the genius of Thomas Brock, R.A., he said, Leeds now possessed one of the finest equestrian statues in the world. The subsidiary features executed by Messrs. Drury, Pomeroy, and Fehr were also excellent examples of the sculptor's art, but he thought the value of these figures of Leeds worthies would have been greatly enhanced if they had been placed in some isolated situation. During the last few years Leeds had seen the sweeping away of vast blocks of dilapidated and insanitary property, and the upraising of structures, whether beautiful or not, at least fitted with every modern convenience and appliance. Broad thoroughfares had appeared, some of them leading to nowhere in particular. The electric tramways had created an inclination on the part of the authorities for rounded street corners; an inclination which had developed into a mania. Alluding to the making of new streets, Mr. Wilson said one was constrained to consider whether the arteries of traffic could be diverted by the tempting prospect of a broad thoroughfare which was even a little off the main line. Piecemeal improvements were futile unless they formed part of a prearranged scheme. Alluding to the aims of the society, Mr. Wilson said parents must be brought to see that for a youth to become an architect he must have a scientific course of training. But what experience or data had such mentors to judge of what qualifications an architect should possess? The status of the architect was less defined than that of a hansom-cab driver. Students went through a short, slipshod, aimless class of training, and were then pitchforked into the profession through the inexpensive medium of a brass plate and a terracotta catalogue. On the motion of Mr. G. Bulmer, seconded by Mr. H. S. Chorley (the hon. secretary), a vote of thanks was accorded Mr. Wilson for his address. A smoking concert followed.

SHEFFIELD SOCIETY OF ARCHITECT AND SURVEYORS.—The monthly meeting of this society was held the other night in the Lecture Hall, in Leopold-street, Mr. T. Winder occupying the chair. An address on "Architectural Education" was delivered by Mr. Hugh Stannus, of London, who remarked that it was a very good beginning for a man to have tried his hand at all three styles—the old Classical, the Mediaeval, and the Renaissance, in addition to the modern. A good knowledge of German would be found helpful, especially in the mastery of textbooks, and some idea of legal work would be sure to prove useful. A budding architect should also keep up his literary knowledge in order to be able to submit a lucid report to any public body. Mr. Stannus advocated that a professorship of architecture and architectural science should be created in Sheffield, in connection with the establishments of higher education. Such a professor ought to give lectures not only to those who were going to be architects, but also to those who were going to be their clients. The people would then realise that the work of an architect was not merely the designing of mouldings or the arranging of extra quantities to a builder. As a native of Sheffield he held that 50 years ago if their forefathers had been courageous, they would never have had the unsightly streets

that now give visitors such a poor opinion of the city. Those Sheffielders, continued Mr. Stannus, who had lived in the city all their lives did not know how the aspect of the place struck a stranger or one who had returned after some years' absence. Why was there not a worthy scheme carried out piece by piece, as occasion offered? The reason, unfortunately, lay in the fact that there was a 1st of November, when councillors were afraid of meeting citizens. He was bound to say a fine thing had been effected in the improvement of High-street and one or two other thoroughfares, but there was a host of opportunities still awaiting the attention of those who are patriotic enough to take advantage of them. A discussion followed, and on the motion of Mr. E. M. Gibbs, seconded by Principal Hicks, a vote of thanks was accorded Mr. Stannus.

CHIPS.

The thirty-first annual dinner of the Institute of Estate and House Agents was held on Tuesday night at the Café Royal, Regent-street. Mr. Ernest Pennington, the President, was in the chair, and Mr. T. Skewes-Cox, M.P., Mr. J. H. Towns-end Green (president of the Auctioneers' Institute), and Mr. W. J. Taylor (secretary) were amongst those present.

The Earl of Rosebery inaugurated yesterday (Thursday) the work of the County Council in commemorating London houses of historical interest by unveiling a tablet at Holly Lodge, Campden Hill, at one time the residence of Lord Macaulay.

Adjudications in bankruptcy have been made in the cases of John Holmes Greaves, Mattison-road, Harringay, N., King William-street, E.C., late Queen Victoria-street, E.C., architect; and of William Henry Waterman, Cullum-street, Fenchurch-street, E.C., architect.

In our report of the meeting of the Quantity Surveyors' Association last week, the chairman, Mr. W. Hoffman Wood was incorrectly described as an F.S.I. Mr. Hoffman Wood is not a member of the Surveyors' Institution.

The new schools, Acton Green, are being warmed and ventilated by means of Shorland's patent Manchester grates, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

At the inquest on Tuesday on the four men who were killed by the collapse of a viaduct in course of construction at Stanway, near Winchcombe, on the new Cheltenham and Honeybourne branch of the Great Western Railway, a verdict of "Accidental death" was returned. The jury appended to their verdict a rider expressing the opinion that sufficient time had not been given for the lime and mortar to set before the centres were removed; and, further, urging that arches of the kind in question, in winter months especially, ought to be set in cement and mortar.

In the appeal for a sum of £300,000 of the joint committee for the removal of King's College Hospital to South London which was recently issued, it was stated that an adequate site had been presented close to Camberwell-green. The site of twelve acres, at present known as The Sanders' Estate, is at the foot of Denmark-hill, close to Camberwell-green, and in close proximity to the three railway stations of Denmark-hill, Loughborough-junction, and Camberwell New-road. In addition to this convenience, the main electric tram lines run from Deptford, New-cross, Peckham, right through Camberwell-green, and a further line up Denmark-hill is now being laid down which will pass the doors of the new hospital.

The Reader in Egyptian Archaeology at Liverpool University, Mr. John Garstang, has completed arrangements on behalf of the Beni Hasan Excavations Committee for an expedition to Egypt during the coming season. The concession obtained from the Egyptian Government includes an extension of the field of last winter's exploration, the results of which were exhibited at Burlington House in July. A special feature in the season's work will be the examination of the great tomb at Negadeh, supposed by some to have been the tomb of Menes, the first of the great Kings of Egypt.

At Falmouth Mr. W. O. Meade-King has held an inquiry on behalf of the Local Government Board into the application of the town council for sanction to borrow £2,100 for the purchase of land and the making of a promenade on the bay side of the sea-front. The town clerk stated that the proposed road would connect Cliff-road and Gyllyng-road, and would be 35ft. wide. The land was a portion of the Gyllyngdune estate.

Mr. George Biss, the senior member of the firm of Geo. Biss and Son, builders, Portishead, expired suddenly about noon on Thursday in last week, while superintending the erection of some buildings near the Esplanade, Portishead.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, Clement's House, Clement's Inn Passage, Strand, W.C., and not to members of the staff by name. Delay is not infrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAHO NEWSPAPER COMPANY, LIMITED.

Telegraphic Address:—"Timeserver, London."

Telephone No. 1633 Holborn.

NOTICE.

Bound copies of Vol. LXXXIII. are now ready, and should be ordered early (price 12s. each, by post 12s. 10d.), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLVI., XLIX., LIII., LXI., LXII., LXIV., LXV., LXVI., LXVII., LXVIII., LXIX., LXXI., LXXII., LXXIII., LXXIV., LXXV., LXXVI., LXXVII., LXXIX., LXXX., LXXXI., and LXXXII. may still be obtained at the same price; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Handsome Cloth Cases for Binding the BUILDING NEWS, price 2s., post free 2s. 4d., can be obtained from any Newsagent, or from the Publisher, Clement's House, Clement's Inn Passage, Strand, London, W.C.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.). To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of eight words, the first line counting as two, the minimum charge being 3s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Situations and Partnerships.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" and "Partnerships" is ONE SHILLING FOR TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

* Replies to advertisements can be received at the office, Clement's House, Clement's Inn-passage, Strand, W.C., free of charge. If to be forwarded under cover to advertiser an extra charge of Sixpence is made. (See Notice at head of "Situations.")

Rates for Trade Advertisements on front page, and special and other positions, can be obtained on application to the Publisher.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

RECEIVED.—G. Monck and Co.—M. F. A.—H. H. K.—R. J. Williams.—S. F. S.—J. M. B.—W. Day and Co.

J. T. GALLETTLEY.—We cannot, of course, say why your applications for particulars were not answered. We have no possible control over the managers of competitions. It is a matter you might bring to the notice of the Competition Reform Society.

"BUILDING NEWS" DESIGNING CLUB.

"FORCE," "ZIGZAG," and "THE KID." (These designs were not overlooked, but we regret that their names were not mentioned, owing to the loss of a page of our review. They were placed among the first series in making our choice. "Force" has many points of merit, with only one entrance, and a very dark passage-way cloakroom. The laboratories are much too small, and, like the art-rooms, are bad in shape. Externally the design is a little overdone. "Zigzag" has a too lofty central hall, with two staircases rising out of it, and the laboratories separated on different floors, the balance and preparation rooms being far away from the physical laboratory. The author is too ambitious, but able. "The Kid" also overdoes a simple problem, displaying ingenuity. The only access to his classrooms is by way of the hall, and the entrance-halls are too big for economy's sake.) The others were "Taquisara," "Desperate," "Lyric," "Sunny Jim," "Gwen," "Marksmen," "Lavernock," "Last Man In," "Mona," "Four Point Seven," "Whiteheather," and "Eagle."

DRAWINGS RECEIVED.—"Antocar," "An Old Scholar," "Frena," "Yew Tree," "Spero," "The Last Man In," "Frouge," "Val."

The parish church at Olney, in Buckinghamshire, which is so closely associated with the poet Cowper and the Rev. John Newton, is to undergo restoration at an estimated cost of £1,300.

Correspondence.

ARCHITECTS' SECRET COMMISSIONS.

To the Editor of the BUILDING NEWS.

SIR,—A correspondent calls attention to this matter in your issue of 20th inst. In my opinion it is one which calls for more urgent attention on the part of the R.I.B.A. and its allied societies than do all other matters now under their consideration put together. Not only are these secret commissions dishonest to the client, who pays far more than he ought to do for his goods, but the "architect" who takes the commissions dare not condemn bad workmanship and material. He is in the power of the contractor or tradesman. Consequently the client gets robbed twice over. Again, the secret commission architect can frequently obtain work against the honest man by offering to work for, say, 2½ per cent., against the other man's professional fee of 5 per cent. By secret commissions the dishonest man frequently receives 10 per cent. in all. All this is perfectly well known to the councils of the R.I.B.A. and allied societies; but notwithstanding the crying disgrace to the profession, no united move is made towards putting an end to this state of affairs, and it is not to be expected that individual members will lay information one against the other. To me such an action would seem as degrading as that of a spy. Many of the tradesmen and sub-contractors, &c., who have to pay these secret commissions to architects would, I know, be only too glad to see an end put to this tax upon them, and some of them, if approached by an authorised deputation from an architectural society, would give such a deputation ample information to work upon and to act upon. Probably one-third of the architects in this country receive these secret commissions now. —I am, &c., F.R.I.B.A.

CHIPS.

The Old Felstedian War memorial window in the chapel of Felsted School, Essex, will be unveiled by Major-General Sir W. F. Gatacre, K.C.B., and dedicated by the Bishop of Colchester, at 2.15 p.m., on Thursday next, December 3.

The Irish Board of Public Works are making considerable additions to the Limerick Post Office. Messrs. Ryan and Sons are the general contractors. The building will be fireproof, and Messrs. Mark Fawcett and Co., of Westminster, have been selected in competition to do this work.

During the last financial year 19 new United Methodist Free Churches were built, and 15 enlarged, affording increased accommodation for over 4,000 worshippers.

The Scarborough Harbour Commissioners have decided to join the local corporation and fishing interests in an appeal to the North-Eastern Railway Company to acquire the existing harbour at Scarborough, and enlarge it by the construction of a deep sea extension outside the east pier of an area of seven and a half acres, and a depth at low tide of 14ft. The approximate cost of the scheme is £250,000.

The Edward VII. Soldiers' and Sailors' Institute at Gibraltar was opened by Field-Marshal Sir George White, V.C., the Governor and Commander-in-Chief. The building has sleeping accommodation for 90 men, and has cost £11,000.

The city of Buffalo has just entered upon what the experience of other cities shows to be a costly and unsatisfactory experiment, in the establishment of an architectural bureau in the department of public works, where plans are to be made for the various buildings required by the city.

At the meeting on Monday of the Newton Abbot Urban District Council, Mr. A. J. Cornelius, who was the late Mr. Silvanus Trevail's chief assistant, was appointed as architect to carry out the work in connection with the Free Library and Technical Schools as the representative of the trustees and executor of Mr. Trevail.

The Hon. Lyulph Stanley, vice-chairman of the School Board for London, presided on Monday at the public opening of a new school in Kingsgate-road, West Hampstead. The buildings will be used as a senior mixed school for the accommodation of 450 boys and girls in the higher standards, and has also in connection with it a special school for about 60 mentally defective children. The buildings have cost about £18,000, and the site nearly £10,000. The contractors were Messrs. Lawrance and Sons. The designs were those of Mr. T. J. Bailey, the architect to the School Board, and the work has been carried out under the supervision of Mr. Westcott, the Board's clerk of works.

Intercommunication.

QUESTIONS.

[12027.]—Reservoir.—Will some reader kindly say if two coats of cement and washed sand, mixed 2 and 1, are sufficient to make a small reservoir watertight, and if not, what is the best covering for the walls? The tank is built of deep under-ground, with 14in. brick walls and a concrete bottom.—C. C. E.

REPLIES.

[12023.]—Breaking Strain.—H. Adams, in hand-book, gives, Table 133, usual allowance for dead load per square inch sectional area.

		BREAKING STRAIN. SAFE LOAD.	
		Tons.	Tons.
Mild steel:—			
Tension	28	7	
Compression	25	5	
Rivets in shear	24	6	
Cast steel:—			
Tension	35	8	
Compression	50	12	

The compression and shearing values assume that the parts are unable to bend. Approximate strength of girders. Safe load in tons distributed when supported at both ends and loaded uniformly. For steel joist—area one flange $\times 5 \times$ depth in inches \div span in feet, &c.—REGENT'S PARK.

[12024.]—Rainwater.—You can have nothing better than an underground tank for storing soft water in the country, with a sand filter. The water for drinking should be again filtered through one of the numerous patent filters. A galvanised cistern should be fixed below the roof to catch a portion of the rainfall for the use of the w.c. A pipe from the force pump would supply this in case of need. Drainage should be taken to cess-pool for use in gardens—otherwise to the fields, if you have land adjoining.—E.

[12025.]—Ancient Lights.—It would appear that your correspondent "Light and Air" does not read "Fletchers on Light and Air" quite as it should be read. Pages 22 and 83 to 87 of the fourth edition, I think, make it clear that the blocking up of the opening for twelve months should be before the completion of the period of the twenty years' enjoyment so as to come under section 4 of the Prescription Act, which enacts "that each of the respective periods of years hereinbefore mentioned shall be deemed and taken to be the period next before some suit or action." I must admit, however, that this perhaps might be expressed more clearly, and my joint author and myself will endeavour to do so in the next edition.—H. PHILLIPS FLETCHER, F.R.I.B.A., F.S.I., A.M.I.C.E., Barrister-at-Law.

Mr. W. H. Waterman and Mr. A. A. Abrahams, architects and surveyors, 7, Cullum-street, Fenchurch-street, E.C., have dissolved partnership. Mr. Abrahams will continue to practise at the same address in his own name.

The stained-glass windows placed in Wells Cathedral to the memory of Somerset men who fell in the South African war will be unveiled by the Earl of Cork and Orrery, Lord-Lieutenant of the County, to-morrow (Saturday) afternoon. The general subject of the window, which is placed in the north transept, may be described as "Kings and warriors in the making of England, centring in Alfred the Great." The work has been designed and carried out by Messrs. James Powell and Sons, the Whitefriars Glass Works, Tudor-street, E.C.

The total realisation of the sale of the extensive blocks of freehold property belonging to Lord Kensington, and including Edwardes-square, Kensington, which was sold by private treaty, and which covers an area of about seven acres, was nearly £300,000.

The housing committee of the corporation of Liverpool have received a letter from the Local Government Board approving the spending of £150,000 on the Hornby-street Improvement Scheme, and inclosing their sanction to borrow £64,840 for the purchase of the area; also their sanction to borrow £85,160 for the erection of buildings. The Local Government Board have also sanctioned, as part of the scheme, the erection by the committee of a number of shops and the provision of a recreation ground under the Housing of the Working Classes Act, 1903.

The Hull Sanitary Committee have determined that, in addition to closing unhealthy dwellings, they will protect the landlords by taking proceedings against those tenants who allow their homes to become dilapidated.

To perpetuate the memory of the late Rev. J. H. Scowcroft and Mrs. Scowcroft, a stained-glass window has been placed in St. Matthew's Church, Duddleston. The subject of the window is the "Calling of St. Matthew," introducing the saints after whom the five sister churches are named. The dedication of the window will take place next Sunday.

A new church at The Wyche—a rapidly-growing part of Malvern—was consecrated on Friday by the Bishop of Worcester. The style of the building is Early English—very simple and almost devoid of ornament. The cost was £3,800, and the whole amount has been raised by subscription.

WATER SUPPLY AND SANITARY MATTERS.

DALKEITH.—The new water supply for the burgh was recently inaugurated. For a long time past great inconvenience has been occasioned by the want of sufficient water in the burgh. In their difficulty the town council applied to the Edinburgh and District Water Trust for a temporary supply, in addition to the 100,000 gallons which for many years have been conveyed to the Dalkeith tanks at Easthouse from the Trust's reservoir at Rosebery. They agreed to give 30,000 gallons in addition; but it was found impracticable to convey anything like that extra quantity to the town. Operations were begun some time ago at Bridgend to sink an additional bore, and this has been done by Mr. W. T. Wylie, Linlithgow, under the directions of the water committee. It has been put down a depth of 284ft. The bore is 30ft. from the well, and an adit connects the bore and the well.

LYDNEY.—This town, situate between the river Severn and the border of the Forest of Dean, has been provided with a new system of water supply. The population is about 3,500, and the area is about 7,000 acres. The works include a pumping station at Ferneley Wood, about three miles from Lydney, with reservoirs on the Bream-road, near Rockwood, and about twelve miles of water main in and around Lydney for distributing the water. The pumping station comprises an engine-house with duplicate pumps, the motive power being a gas-engine with complete gas-producing plant, and an oil-engine. The two pumps are of vertical type, and both are capable of delivering 10,000 gallons per hour to the reservoirs, which are 300ft. above the pumping station. The reservoirs are capable of holding 190,000 gallons of water. They are constructed entirely of cement concrete, and are lined throughout with cement. A special feature in connection with the mains is a high-pressure or hydraulic main conveying the water from the reservoir to the high-level district, whereby the pressure is maintained and transferred to the high-level supplies. In the final test of the mains not a single joint out of 180,000 was found defective. The contractor for the engine-house, reservoir, and mains was Mr. A. S. Scull, of Redcliffe-street, Bristol, and the Duddridge Iron Works, Limited, of Stroud, supplied the engines and plant. The works have been designed and carried out under the superintendence of Mr. J. Fletcher Trew, of County Chambers, Gloucester.

LOWER KINGSWOOD.—The site proposed for the outfall works in connection with the second instalment of the Kingswood drainage scheme, and comprising the lower portion of the parish, is situate in the parish of Oldland, and is precisely the same as that recommended the parish four years ago by the engineer, Mr. A. J. Saise. The site is 30½ acres in extent, and is in the area of the Warmley Rural District Council. The system to be adopted is bacteriological. The sewage is brought down into tanks, and from the tanks it is taken over a filter-bed made of clinkers in order to get exposure to the air. The sewage is distributed over the filters by patent distributors. Storm-water is diverted to a specially-prepared filtering area, and the filtrate, together with the discharge from the primary filters, is discharged into a tributary of the Avon—viz., Siston Brook. The estimated outlay is £11,500.

The new post-office at Spennymoor, Co. Durham, was opened on Friday. It is situated in Tudhoe-grange Market. The contractor was Mr. William Lazonby, of Ferryhill.

The Local Government Board inspectors, Mr. E. P. Burd and Mr. H. Percy Boulnois, C.E., sat for five days of last week at Plymouth, ending on Saturday, to inquire into the application of the Plymouth Town Council for sanction to borrow £248,252 in respect of capital expenditure incurred for electric lighting, sewerage, street improvements, parks, labouring-class dwellings, and other works; £3,000 for repairing Sutton-road; and £6,700 for electric lighting.

St. Anne's Church, Edgeside, Lumb Valley, will be reopened to-morrow (Saturday) after renovation and internal decoration. Mr. E. Hult, of Percy, is the builder, and the decorators are Messrs. Lord and Hodgson, of Waterpool. A stained-glass window has also been placed in the church as a memorial.

The Leeds tramways are to be extended some dozen miles in all during the next few months at a cost of £100,000. The Elland-road line is to be extended to Churwell, and a branch from Elland-road is to run along Domestic-street and Holbeck Moor-road. Lines are being laid along Stanningley-road and Compton-road to the east. The Stanningley-road line is to be carried a distance of 2½ miles to the boundary at Rodley, whilst the Whitehall-road and Kirkstall-road routes are to be extended, the one to the city boundary and the other to Calverley-lane End in Horsforth. New lines are also to be laid in Great Wilson-street and Waterloo-road.

Our Office Table.

"ART *contra* the World, the Flesh, and the Devil," was the title of a lecture delivered by Sir Wyke Bayliss on Sunday night before the London Spiritualist Alliance, at the Salon of the Royal Society of British Artists. The main topic was the duties of Art, in fighting side by side with Religion, the battle of life against the "common enemy." Religion and Art, the lecturer said, seemed always to be tied together in the relation of mistress and handmaid. It was an alliance of two forces, Spiritual and æsthetic, moving in the same plane, to the same end, against that common enemy. It involved a recognition of the relationship between us and God, and, in that sense, the two forces could not be separated. The common enemy was strong, but love was stronger. The force of Art was greater than gold, or, if not greater, at least it was more subtle, and more adapted to our needs. True Art, not merely in sculpture and painting, but in music and literature, was eyes to the blind, strength to the weak, gentleness to the strong, manhood to youth, restitution to the wronged, greeting to the absent, faith to the doubting, love and charity to all. Without the hope of life that came with Christ, Art would never have built our great cathedrals and temples of worship. As for the artist, it was enough that he lived, and worked, and died; but Art passed into the national life, and became immortal.

Among the Parliamentary projects for next session of interest is that of the City Corporation, who will apply for powers to rebuild Southwark Bridge, and also to discontinue the use of the high-level footway of the Tower Bridge. In view of the approaching completion of the Great Northern and City and Great Northern, Brompton, and Piccadilly Railways—tube lines to run from Finsbury Park to the City and West-end respectively—the directors of the Great Northern Railway will seek powers next session for the widening of their High Barnet branch between Finsbury Park and Finchley, so as to provide three tracks instead of two between those points. The scheme will involve the rebuilding of the stations at Strand Green, Crouch End, Highgate, and East Finchley. Some sixteen minor branch lines are contemplated by the Bill to be introduced by the Great Western Railway Co. These include a new line from Llanelli to Llansamlet and Coedffranc; another from Bettws, Carmarthen, to Llangnick in Glamorgan; new junction lines in Swansea, Grafton, Camerton, Monkton to Limpley Stoke, Dunston, Rowley Regis, and from Gloucester to Filton and Stoke Gifford. The Metropolitan District Railway seek powers to extend the subway at South Kensington as far as the Albert Hall, and also to charge on their system of lines uniform or zone fares. The Postmaster-General will seek powers to acquire lands, houses, and buildings in the Metropolitan boroughs of Holborn, Greenwich, and Lewisham, the urban district of Southgate, Middlesex, and the boroughs of Blackpool, Leeds, and Newcastle-upon-Tyne, for the service of the Post Office.

The report to the Government of India on the work of the Geological Survey for the past official year says that in the field of economic inquiry definite and satisfactory results have been yielded by the investigations into the occurrence of coal in parts of the Punjab, and near Shillong in Assam, of chromite in Baluchistan, and of iron ore in the Dhar Forest. Evidence has also been obtained of geological features favourable to the occurrence of petroleum in Burma; but less definite results have followed the investigation of the auriferous areas in Chota Nagpur. Gold is widely distributed in the reefs and alluvial deposits; but it is not clear that it is concentrated anywhere in paying quantities. The area, however, has not been exhausted by the investigations; but the explorations will not be continued by the Government. Much progress has been made in mapping previously unsurveyed ground in Madras, the Shan States, the Assam hill region, and forest tracts in Central India. The geological department may be expected in the future to take an active part in the development of the country, as the exploitation of its mineral wealth is now proceeding at a constantly increasing rate. Its inquiries of an economical nature are of pressing importance, and it will be judged largely by the aid it is able to give in working the natural resources of India.

In the near future effect is to be given to a big

building scheme at Stechford, near Birmingham. An estate of fifty-two acres has been acquired, and a newly-formed company, with a capital of £20,000, is to exploit the area for the building of house property. On the one side the estate extends along the railway towards Marston Green, and the site affords space for between nine hundred and a thousand houses. A few of these on the lower or north side of the railway will probably be let at 7s. 6d. or 8s. per week; but in the case of those on the south side of the line the rental will be 9s. or 10s. Each house will have a bath, and the company is to plant the gardens with a number of fruit trees, and in other ways—by means chiefly of horticultural prizes—induce the tenants to take an interest in their gardens. The streets are also to be lined with avenues of trees, and there will be two miles of roads. To avoid the monotony of style so common to suburban Birmingham, it will be stipulated that not more than four houses shall be exactly alike.

In their report to the corporation of Bristol on the condition of the Old Dutch House at the corner of High-street, in that city, Messrs. Douglas and Minshull, of Chester, state that as the result of their examination, externally and internally, it is evident that the building would require considerable repairs. As to the possibility of setting back the ground floor so as to effect a desired street improvement without disturbing the upper part, they state that having regard to the tracing submitted to them showing the proposed new line of footpath, they think that the superstructure will not lend itself to such a treatment, and that the height at the angle under the overhanging first floor would be inadequate for roadway requirements, whilst the lighting of the shop would also be interfered with. Messrs. Douglas and Minshull add that they have prepared a sketch showing how the building could be set back to the proposed improved line of roadway, using the old framework as far as possible, and reconstructing it on the new line, by which means the characteristic features of the structure would be preserved and a street improvement secured.

M. REDON, architectural expert of the Louvre Museum, announces that the Louvre Palace lies buried to a depth of 7½ metres, or over 24½ft.—that is to say, nearly a third of its entire height. M. Redon explains that he had a trench dug in a garden adjoining the Louvre, and brought to light a magnificent stonework sub-structure before reaching the foundations. This buried portion is described as being fully as fine as the basements of the grandest Florentine palaces. M. Redon has come to the conclusion that in the original scheme a moat, some 50ft. wide, was to have surrounded the palace, but it could not be excavated to its full width, as at the time the building stood in the midst of houses. When the latter disappeared the original plans had been forgotten, and the level of the soil gradually rose to its present height. The committee for the preservation of old Paris has taken up M. Redon's discovery with enthusiasm, and as soon as funds can be got together the excavation of the moat whence the noble frontage will rise at last to its full height will be begun.

An aerial ropeway from Gatehouse Quarry, near Loch-na-Craig, to Aberfeldy Railway Station, constructed for the Highland District Committee of the Perth County Council, was inaugurated the other day. For several years past the committee have had a heavy expenditure in connection with the working of their road-metal quarries. The bulk of the quarries being situated high up in the hills entailed a heavy carriage before the metal was got to the main roads. In order to remedy this, the district committee, on the advice of Mr. William Bell, C.E., road surveyor, resolved to construct an aerial ropeway for the conveyance of broken road metal. The ropeway is about 2½ miles in length, and consists of an endless wire rope running on pulleys on the top of steel trestles about 30ft. high. Hung from this wire rope are a hundred iron skips or buckets, each capable of carrying 2cwt. of broken metal, or about 80 tons per day of nine hours. A steam engine of 25H.P. at the quarry drives the ropeway, the stone-breaking machine, and rock drill. The cost of the ropeway was about £4,000.

The Stretford Urban District Council have received from Mr. Ernest Worrall, their engineer, a report on the use and merits of concrete flags for pavements, based on two-and-forty replies from authorities who are utilising these flags. The

almost universal statement is that in initial cost flags made of concrete are cheaper than natural quarry stones, while concrete flags are regarded as durable so long as they can remain undisturbed for repairs to mains. In the matters of foothold and appearance, they are generally regarded as equal or superior to quarried flags. The usual thickness is 2½ in., and to secure a satisfactory flag the concrete must be machine-pressed—a point which Mr. Worrall in his summary of replies regards as a *sine qua non*.

The American Consul-General at Berlin, in a recent report, describes cement manufacture as one of the great and long-established industries of Germany in which the capacity for production is excessive and disproportionate to the normal consuming power of the people. In 1901 Germany consumed 14,600,000 barrels of cement, while the producing power of the factories was 29,000,000 barrels per annum, so that production is double the home consumption. It is believed the excess in 1901 was 10 to 12 million barrels, of which the export only reached 506,652 tons, "leaving a large excess, which broke down the market, reduced profits to a pittance, and brought on a crisis in the industry from which it has not yet recovered." The postponement of the work on the Rhine-Elbe Canal, for which the cement factories had prepared, contributed to over-production. Efforts were made to form an all-embracing cement trust to restrict production, but in vain; the supply everywhere exceeded the demand. The general industrial and financial depression caused building to slacken, while labour and fuel—two main elements in cement production—remained as high as before. Exports formed the only resource, and these increased from 497,780 metric tons (2,205 lb. each) in 1898 to 641,520 tons in 1902. Of this the United States took 246,726 tons last year, British South Africa 36,720, and Great Britain 33,534. To shut out an import of about 50,000 tons from points immediately over the frontier in adjacent countries a duty has been imposed on imported cement, which was formerly free of duty. The Consul-General adds that only the oldest and largest German factories, with every advantage of position, are able to earn any substantial profit at present, and many of the newer and smaller establishments are working at a loss.

DUPLICATION of iron and steel members has, says the *Engineering Record*, been secured in a remarkable degree in the Varick Realty Building at Hubbard, West and Washington streets, New York; Mr. W. H. Birkbine, architect. The building is about 229 ft. by 116 ft. in area, and eleven stories high above the basement, having twelve tiers of steel beams and cast-iron columns. The self-supporting walls are entirely independent of the framework, but do not carry any of the floor load. The interior columns are round and the wall columns are square, all made with standard details for connections, and planed flange joints. They are seated with heavy cast-iron pedestals on concrete piers, with pile foundations. One sheet of the detail drawings calls for 915 columns, and another sheet, with three sketches, calls for 3,379 floor beams. The whole job is detailed on 24 in. by 30 in. tracings, and has a total weight of about 2,700 tons. It is being erected by means of several stationary derricks with very long booms. The J. B. and J. M. Cornell Company are the contractors, and Mr. H. H. Forsyth is in charge of the detailing of the framework for the building.

The new rifle barracks at Winchester, which have been built in place of those destroyed by fire a few years ago, are now ready for occupation, and are about to be taken over by the Rifle Depot, under the command of Colonel H. R. Mends, from Gosport. When the quarters at Gosport are vacated they are to be completely overhauled and repaired before being occupied by a line battalion.

The city council of Belfast have voted a gratuity of £250 to their assistant surveyor, Mr. Munce, for having discharged the entire duties of the office of surveyor during the past fourteen months.

The monument to the men belonging to H.M.S. *Doris*, who fell during the South African War, will take the form of a monument to be erected in the Park at Devonport, from designs by Messrs. Harry Hems and Sons, of Exeter.

At Monday's meeting of the Council of Ripon plans of the proposed Spa buildings and baths were laid on the table. It was stated that the plans would be submitted in detail to the sanitary committee, and that Mr. W. Stead, of Harrogate, had been appointed architect at an inclusive fee of £250.

MEETINGS FOR THE ENSUING WEEK.

MONDAY.—Royal Institute of British Architects. Business Meeting. 8 p.m.

Society of Arts. "Mining of Non-Metallic Minerals." Cantor Lecture No. 2, by Bennett H. Brough. 8 p.m.

TUESDAY.—Institute of Civil Engineers. Discussion on "The Distribution of Rainfall over the British Isles." 8 p.m.
Institute of Builders. "A Comparison of English and American Methods of Building." by C. Heathcote, F.R.I.B.A. 8 p.m.

WEDNESDAY.—Society of Arts. "The Fiscal Problem." by Sir C. Malcolm Kennedy, K.C.M.G., C.B. 8 p.m.

FRIDAY.—Architectural Association. "Photography for Architects." by Members. 7.30 p.m.

SATURDAY, DEC. 5.—Sanitary Institute at Leicester. Discussion on "The Collection of Town Refuse." 11 a.m.

THE ARCHITECTURAL ASSOCIATION.

DECEMBER 14th: ORDINARY GENERAL MEETING at No. 9, Conduit-street, W., at 7.30 p.m. PAPER by the A.A. Camera and C.-clung Club on "Photography for Architects," to be read by Mr. FRANCIS R. TAYLOR, illustrated by lantern views.
LOUIS AMBLER } Hon. Secs.
HENRY TANNER, Jun. }

CHIPS.

Mr. W. H. Grimsdale, chief engineer of the Warrington Electricity Department, and manager of the electric tramways, has resigned upon having been appointed to superintend the electrification of the Government dockyard at Portsmouth.

The Dean and Chapter of Rochester have decided to rebuild the central tower of the Cathedral from plans by Mr. C. Hodgson Fowler, F.S.A., of Durham. The design will be in harmony with the rest of the building; it will closely resemble the original tower, and, like it, will be capped by a spire in oak and lead. The donation of £5,000 recently given to the Dean and Chapter by Mr. T. A. Foord, a native of Rochester, will be applied towards this work.

At Colne, Lancs., on Tuesday, Major Druitt and Colonel Trotter inspected on behalf of the Board of Trade the new line constructed by the Colne and Trawden Light Railway Company. The new line joins on to the Nelson Corporation tramways, and completes a large electric tramway system, joining several of the main centres of population in North-east Lancashire.

A meeting of the Ordained Surveyors' Students' Society was held in the Edinburgh Architectural Association's rooms, 117, George-street, on Monday night. Mr. Carrick occupied the chair. Mr. T. Fairbairn, ordained surveyor, read a paper on "Valuations."

Considerable distress prevails amongst the brick-makers and general labourers in the Black Country, and at the West Bromwich Board of Guardians, on Monday, the ex-mayor of the borough (Mr. Cheshire) proposed that extra relief be given for three months to the outdoor poor of the union. The resolution was lost, but the relief committees were instructed to favourably consider the applications for extended relief necessitated by the cold weather.

The reopening and reconstruction of Wretton Church by the Suffragan Bishop of Thetford took place on Tuesday week. This church has for some weeks past been in the hands of Messrs. Hawes, contractors, of Norwich, undergoing extensive repairs. The repairs consisted of reseating the church throughout, lowering and retiling the floor, replastering the walls, and repairing the roof, the cost being about £240. The tower of the church was restored about three years ago at a cost of £220.

The extensive premises of Messrs. Thornton and Sons, building contractors, Thornton-place, Toxteth, Liverpool, were gutted by fire on Sunday.

Bishop Alan Webb (Dean of Salisbury) dedicated, on Wednesday, the ancient chapel of St. Catherine, "the Chapel in the Woods," Milton Abbey, which was founded by Athelstan, and which has been restored by the generosity of Mr. Everard Hambro. Since the Reformation the chapel had fallen into disrepair, and had been used for various secular purposes.

The Archbishop of Canterbury visited Herne Bay on Friday, and consecrated a chancel which has recently been added to the Church of St. John the Evangelist. The church itself was consecrated in July, 1893. The new chancel is in the Decorated Gothic style, with sedilia and credence in the south wall. The east window comprises five lights, representing the Annunciation, the Nativity, the Crucifixion, the Resurrection, and the Ascension, surmounted by a round light representing Christ in Glory. The design was carried out by Messrs. Percy Bacon Brothers. The choir stalls are carved in oak. The church has cost £11,000.

The church of All Saints, Penfai, near Bridgend, which has been built at his own cost by Mr. R. W. Llewellyn, was consecrated by the Bishop of Llandaff on Monday. The church has been built to Mr. Llewellyn's own designs, and contains sculpture which he brought from Florence, and an alabaster reredos, of which the central panels were designed by Mr. Goscombe John, A.R.A. In the tower bells have been placed named after members of the Llewellyn family, and the principal stained-glass window in the church is placed there by Mr. Llewellyn and his sisters as a memorial of their father.

The President and Council of the Royal Academy will, on Dec. 15, proceed to the election of a Cooke annuitant. This annuity is of the value of £35, and applicants for the same must be painters in oil or water-colour, not less than 60 years of age, and in distress from age, sickness, or some other cause.

St. Peter's, Newton, in the parish of Oystermouth, at the Mumbles, was consecrated on Thursday in last week. The new church, which has cost about £7,000, stands on a corner site overlooking the Bristol Channel and the district around. The style adopted is Decorated. The aisle windows are pointed, and the clerestory windows square, with traceried heads. The tower, not yet built, will be placed at the south-east angle of the nave, and will rise to the height of 90 ft., with a staircase turret, giving access to each floor and to the roof, and large enough to contain a peal of bells. The total inside breadth of the church is 56 ft., and the length 119 ft. The chancel is 25 ft. wide by 37 ft. long. The church, when completed, will accommodate over 600 persons. The nave and aisles will be furnished with chairs, while the chancel is to be fitted with oak stalls. The architect is Mr. E. M. Bruce Vaughan, Cardiff.

At Walton-on-Thames Church a further discovery in the south wall of the chancel has been made, bringing to view a sedile of the Perpendicular period, constructed of grey stone, and measuring about 4 ft. high by 2 ft. wide. This is situated between the ambry discovered a short time ago and the piscina, but not nearly as ancient as the former, which is of very crude workmanship of early style, and made partly of a chalky stone, whereas the latter is partly of freestone. The three niches form a very picturesque group, and should cause much interest to archaeologists, owing to the different periods of their construction and the marks and inscriptions cut in the seat and sides of the sedile. The investigation is under the supervision of Mr. A. E. Gough.

By order of the First Commissioner of Works, a new entrance is being constructed to Bushy Park, near the Hampton Court barracks, by the west side of the Royal green opposite the Trophy-gates entrance to the Palace. The entrance will include a single gate, with a large pair of gates at the side, but the latter will be used only on special occasions. As a part of the scheme a small bridge is to be thrown over the stream by the side of the Row paddock, and the locked gates at each end of the Pheasantry will be opened. By this new addition a more direct route will be secured to Hampton Court for the residents of Upper Teddington and Hampton-hill.

Parliamentary sanction is to be sought by a company to be formed for the purpose of constructing a pier at Broadstairs, which will commence just south of Victoria Gardens, and will run out into the sea for a distance of 1,300 ft.

Mr. Olley sold by auction on Wednesday, Christ Church, South Wimbledon, together with its accessories. The building, a large iron one situated at the corner of Graham and Hartfield roads, was originally transferred from Newington, and the work has now ceased. For the building the preliminary bid was £10 and the final one £70, for which the building was sold to the South London Joinery Company. The pews realised £2 19s., making an average of 1s. per pew. Commandment, Creed, and hymn tablets were sold for a total of 5s., and the pulpit fetched 15s. The stone font was sold for a guinea, a dial clock for 26s., and the "vestry," a wooden erection, for 8s. With the numerous other accessories—stoves, iron piping, matting, hymn-books, collecting-boxes, and alms-plate—the sale realised £83 11s.

At the north-east entrance to Islip Churchyard, which surrounds the church, a lychgate has been erected by the Agutter family. The work was carried out by Mr. Charles Pettit, builder, of Thrapston, from a design by Messrs. Townsend and Fordham, architects, of Peterborough. It is constructed of oak and pitch pine on Weldon stone bases, and covered with red Broseley tiles, surmounted by a cross.

For a long time past the condition of the sewers in Princes-street, Edinburgh, has been a source of trouble to the burgh engineering staff, as well as to the inhabitants of that thoroughfare. Under the direction of Mr. Massie, the burgh engineer, the old sewers, which varied greatly in diameter, are being reconstructed at a cost of £7,000.

Among the medals presented by the Council of the Society of Arts for papers of exceptional value read during the session is one to Mr. G. F. Bodley, R.A., F.R.I.B.A., for his lecture on "Some Principles that may be Guides for the Applied Arts."

The new waterworks at Minster-in-Sheppey, just constructed for the Sheppey Water Company, were formally inaugurated on Thursday in last week.

The Art Gallery Committee of the Rochdale Corporation have accepted the gift from Mr. R. Taylor Heape of eight valuable pictures, as additions to their permanent collection. Two are by F. Goodall, R.A., and the other six are works by R. Ansdell, R.A., Sir P. Burne Jones, J. C. Dollman, J. D. Harding, David Roberts, R.A., and James Sant, R.A.

The Leeds City Council have decided to proceed with the application for the extension of the city boundaries by the inclusion of a number of suburban areas totalling 15,000 acres.

The education committee for Norwich have appointed Mr. C. J. Brown, the architect to the Dean and Chapter of that city, as their architect at a salary of £200 a year, to include all general work executed at a less cost than £1,000, above which sum a special arrangement will be made.

The sales at the Mart last week (including the Kensington Estate sale at Winchester House), as registered at the Estate Exchange, amounted to £267,036, and for the corresponding week of last year to £149,884.

An arbitration was recently held by Mr. Daniel Watney as to the price to be paid by the urban district council of Uckfield for land at Crowborough, belonging to the Marquis of Abergavenny, and required for sewerage purposes. The award has just been published, and amounts to £3,600.

The War Office are about to invite tenders for the erection of a new block of buildings at the Royal Military College, Sandhurst, to provide accommodation for an additional 300 gentlemen cadets. The present college has room for 350 or 360 cadets. It has also been decided to erect apart from the college a block of married quarters for the families of the non-commissioned officers. A block of officers' quarters is also to be built, and for all these works a sum of £365,000 has been voted. It is hoped to commence operations in the early part of next year.

The town council of Southampton have adopted plans and estimates by the borough surveyor for another pavilion to be added to the isolation hospital at an estimated cost of £5,200.

Dawbury Joint Hospital Board have decided to apply to the Public Works Loan Commissioners to borrow £4,000 to complete the new hospital at Earlsheaton.

The Duchess of Albany will unveil the Surrey County memorial to Queen Victoria, at the County-hall, Kingston-on-Thames, on Friday, December 11, at 2.30. The memorial consists of a terracotta statue of the late Queen, showing her as she was at the time of her Coronation, seated in the Coronation chair in her Coronation robes, and holding the sceptre in her hand.

The London County Council have just had erected at the cemetery at New Southgate a massive memorial to the memory of the 51 patients who lost their lives at the fire at Colney Hatch Asylum on the 27th January last. It is a granite runic cross on die and plinth, the front of the shaft and wheel being decorated with carved interlaced work of Runic type. Next to the inscription is an enlarged model of the London County Council official seal in solid gunmetal. The whole is in grey Aberdeen granite.

Professor Henry Louis, of Newcastle, who was sent out by the Government to investigate the asphalt deposits at Trinidad, addressed a meeting on the subject on Monday night at Newcastle-on-Tyne. It had been suggested that the so-called pitch lake from which 120,000 tons of asphalt were dug annually was inexhaustible, but Professor Louis said he had been able to prove that this was not so. The level of the lake had sunk to a degree corresponding exactly with the quantity taken from it. If they knew the depth of the lake they would know to a ton how much asphalt was in it.

The Barrow-in-Furness Corporation is promoting a Bill in Parliament for powers, amongst other things, to build a bridge across Walney Channel, at an estimated cost of £124,000. The Bill also seeks powers to construct several tramways within the borough and a tramway across the proposed bridge.

On Sunday a stained-glass memorial window was unveiled in St. Aidan's Church, Bamburgh. The subjects of the window are Faith and Charity, with St. Cecilia in the small triangular pane, the work of Messrs. Bacon Brothers, London.

Mr. E. T. Price, who has been for the past five years the clerk of works at Truro Cathedral, representing Mr. F. L. Pearson, the architect, during the building of the nave and central tower, is about to leave for Johannesburg, where he will superintend the building of a parish church and hall of St. Mary, the architect being Mr. G. H. Fellowes Prynne, of London. Last week Mr. Price was publicly presented at Truro by the ex-Mayor in the name of the subscribers with an illuminated address and a purse of twenty guineas as an appreciation of his work at the cathedral, and public services in other ways, including the chairmanship of decoration committees. A second presentation was made to Mr. Price on Tuesday, when the Bishop, Dr. Gott, in the name of the Cathedral Committee, presented him with an illuminated address and a cheque for £50.

At the London Consistory Court, on Thursday in last week, Dr. Tristram, K.C., granted a faculty, as prayed for by the vicar and churchwardens of St. John the Baptist, Greenhill, Harrow, for pulling down the present church and rebuilding it on a larger scale, so as to provide increased accommodation, the population of the parish having been largely augmented since the church was built. The present church was erected in 1866, and seats 470; the fabric shows signs of settlement, and is shored up in five places. It is proposed to rebuild the church in three sections, and when reconstructed it will afford room for 890 persons. The cost of the work will be about £18,000. Subscriptions amounting to about £7,000 have already been promised.

The 15th-century church of SS. Probus and Grace, at Probus, Cornwall, is about to be enlarged at the cost of Mrs. Hawkins, the chief landowner in the parish. The south aisle is to be extended, and a vestry and organ chamber will also be added on that side of the church. The north chancel aisle will be fitted up as a morning chapel. Oak screens will be provided in aisles and chancel, and the east window of the chancel will be filled with stained glass.

Major - General Baden - Powell unveiled on Sunday, in the church of St. Martin's-in-the-Fields, a bronze tablet to the memory of the officers and men of the 18th, 21st, and 23rd battalions (sharpshooters) Imperial Yeomanry who died in South Africa during the war.

A memorial screen and tablet erected in the Warrington parish church by the officers, non-commissioned officers, and men, past and present, of the 3rd Battalion South Lancashire Regiment, to the memory of their comrades who lost their lives in the South African war, were unveiled on Saturday. The screen (Late Perpendicular in style) is of English oak throughout, and is divided into seven bays. Crowning the central canopy is the figure of an angel representing "Victory," carrying in the right hand an uplifted sword, and in the left a wreath of bay.

The Bath Corporation Waterworks Committee interviewed on Friday selected candidates for the post of waterworks engineer, at a salary of £350. Mr. J. Dent Young, engineer to the Bath and District High Level Waterworks Company, and Mr. N. J. Peters, Cardiff, were successful at the first ballot, and on a second ballot the voting was equal, and the chairman gave a casting vote in favour of Mr. Young, who was for six months acting engineer to the Bath Corporation.

FRIDAY, DECEMBER 4, 1903.

PROFESSIONAL QUESTIONS.

MANY and conflicting interests affect the profession of architecture at the present day. What with the questions of architectural education, statutory registration, competition reform, assessors, ancient lights, conditions of contract, and other subjects referred to by the presidents of the architectural societies in their inaugural addresses, the architect has enough to engross all his spare moments; for he must, to a certain extent, keep pace with these movements that are always going on outside his own special sphere. Nothing of the kind ever interrupted the calm tenour of the life of the architect of a previous generation. There were no such needs for restricting the entrance to the profession by examinations or registrations, few troubles about competitions; owners could build when and how they liked, without troubling about building by-laws, the law of ancient lights, and other regulations imposed by authorities of the present day. With, perhaps, the two exceptions of sanitary and fire-resisting construction, our forefathers were not much the worse off; their buildings were substantial and comely in appearance, there were fewer men in the profession, so that the evils of competition were not felt; and although there were no facilities for professional education such as we now possess, the architects of half a century ago were often competent and able men. But they worked in limited spheres, and building was comparatively simple. And the trades employed in building were equally competent; the apprentice system was in vogue, there was no undercutting nor overlapping of the trades, and the temptations to the "ca'canny" and "go easy" methods of labour we lately noticed did not prevail. Several reasons exist for the change in the building trades;—they have become more numerous; but, despite our progress, we cannot supersede the principles of honest labour. One writer some time ago attributed the present incompetence rife in the building trades not so much to the labour as to the supervision. "Incompetent foremen and estimators, clerical routine instead of practical execution, a smattering of technical knowledge instead of experience—these are the evils of the trade, and, coupled with trading on borrowed capital, or working the jobs on the strength of the 'draws,' constitute the real crisis." How many real builders apprenticed to the trades as a whole are now found? There is much justice in the indictment; the whole machinery of building is changed, the division of labour, mechanical routine, machine work, and over-supervision have taken away all individual effort and interest in workmanship. These are facts which lie at the root of the question. The experience of age and the natural gifts of a man are no longer taken into account by the "big" firm of builders. The "too old at fifty" idea is another prejudice of the large firm; the experienced workman is superseded by young, but inefficient, men. We are living in an age of specialism, the natural outcome of divided labour and contracting on a large scale; and this is a question of importance which deeply concerns the profession. Already we have specialists in certain branches of building, men who confine themselves to hospitals, and schools, workhouses, baths, labourers' dwellings, and technical institutes, and there is a likelihood that this tendency to split up the pro-

fession into branches will continue. It is partly the result of enlargement of the architect's field. A century ago the architect practised in a few well-defined branches; now they have multiplied indefinitely. All these changes have considerably helped to destroy the cohesion of the older system, and to add immensely to the labour of the profession. The architect must now ask himself, on entering the ranks, "To which branch of practice should I belong? Is it wise to practise in all the branches—in other words, to become a general practitioner?" These and other questions ought to be asked before the young architect has finished his studies. We are afraid the keen competition among the younger members is a strong inducement to them to accept any class of work which is thrown in their way, and that it is a long time before the architect can afford to pick and choose work. In the present very varied practice of a general practitioner, it is hardly possible to master the types and details of every kind of building, and the consequence is a rather superficial acquaintance with certain structures. On the other hand, by confining one's attention to one class of architecture, the architect is able to grasp the principles of plan, and to devote his attention to its many details. No doubt there is a disadvantage. The specialist is generally strong in plan, the plant, and details and fittings, and is apt to pay less attention to external design, and in some cases he relegates the latter part to an expert in draughtsmanship, with doubtful results. The elevations do not express the architect's meaning, or they are extravagant and devoid of character for the particular building. Modern architecture suffers a great deal from this subdivision of the art—plan by one, mechanical equipment and details by another, and the external elevation by a third. The trades are also conflicting, and their harmonious union is sacrificed. And this is one of the vital difficulties which the profession have to face. How are they to bring themselves again in touch with the crafts and trades connected with building, where, as we have seen, these have all become independent, either under the control of a contractor or as expert tradesmen on their own account. One in the trade recently wrote: "Except for the use of scaffolding and hoisting of machinery, is there any job which could not be worked by a manager for the architect and client as effectively as a manager or foreman now does it for a builder? With a reliable man and a depot for the hiring of scaffolding, &c., and the working of stone by stone firms, and joinery by joinery firms, the real practical builder could be on the works, the staff regulated by the size of the job. The architect would then be in touch with his work without the intermediary either as a capitalist or a clerk of the works." For a long period the big contracting firm has been an influence, and the practical builder and craftsman have had to take a secondary place; under the modern régime of specialism, we may again find it possible to make our builders and craftsmen responsible men working in their own interest.

Professional education must, of course, be influenced by the condition of building and the trades; by the demand for specialism, technical knowledge, and the like. These have made a higher standard of knowledge necessary for an acquaintance with manufactures and processes and scientific principles and details, which have been introduced during the last thirty or forty years. An architect must now master a good many more trades and details of a scientific, sanitary, and industrial kind than were required of him in the first part of the last century. The materials of building are more numerous. Take even the natural products of foreign and Australian timber, to say nothing of building stones.

Appliances and mechanical plants have multiplied, and these have all to be understood and applied. The old practitioner never troubled himself about floors and roofs or partitions that could withstand fire; the modern is beset with a host of patented systems. Such a thing as reinforced concrete, in which steel rods or "expanded metal" is embedded in the body of concrete, was not contemplated. The deductions of physics, chemistry, electricity all come within the modern architect's sphere, and are applied to many problems of construction. All these subjects have widened considerably the range of the architect's knowledge outside the art. Questions about acoustics, steel cantilever and dome construction; about the behaviour of metal under heavy loads, heat, corrosion; the chemical value of paints and varnishes, and modes of treating iron, stone, and wood are constantly cropping up. The architect has to be constantly ready to consider questions relating to heating and ventilating arrangements, and to be able to advise as to the best system; to understand the application of electric power in buildings, lighting—subjects which were quite outside the sphere of the profession not many years ago. Although there are specialists who undertake these matters, the architect is the first one consulted, and his opinion on the desirability of a certain system ought to be based on correct views and a knowledge of general principles.

There are professional questions as to which the architect has now to make up his mind. One of these is the subject of competition. As our readers are aware, there has been much controversy about the system; a great deal of dissatisfaction about the modes of invitation, inadequate instructions, unfair decisions, and so on. The professional man of to-day ought to be able to decide for himself whether a certain competition is a fair one or not for him to take part in. The conditions issued ought to be able to afford him evidence of the fact. The selection of a design may not be a good or honest one; but that is not the point. The question is, Are the terms of the competition above board, and such that a professional man may accept them? It ought to be evident on the face of the instructions whether they are so or not. The matter is one for the profession themselves to consider. Unfortunately, it is quite true that many architects are found to enter into competitions which are obviously unfair, in which the conditions are scandalously dishonest to the profession, or the premiums are an insult. Such conduct on the part of some of the profession is discreditable to the body as a whole, and lowers considerably the public regard for it. The recent action of the Abergavenny School Board in advertising for an architect, and requesting candidates to state their terms, and the response, is a degrading instance. A Competition Reform Society, for the purpose of promoting reforms and improved conditions, has been established, and has done, we believe, useful work in "blacklisting" competitions or in suggesting conditions more satisfactory, or in revising them; but we are afraid that there are men in the profession who are willing to respond to invitations on any terms, and so long as this anomalous state prevails, promoters of competitions will remain obdurate. As the President of the Society of Architects said the other day, such a practice required to be dealt with with a firm hand. Architects ought to be restrained from committing themselves to terms which no respectable profession would tolerate; but this restraint can only be learned by educating the members to a true sense of their vocation and responsibility. A statutory authority, as Mr. Thomas said, could control the profession, and it would do so by inculcating the value of professional conduct and making it a condition of qualification to practise; and it may well be asked why it was left to new societies to take these matters up. The architect ought to be

able himself to discriminate between reasonable and unreasonable conditions; but the truth is, the profession wants guidance and co-operation in these matters. Architects have not all the intellectual and moral force required; there is a want of social cohesion in their ranks which terribly weakens their power of resistance, as it does in those of lower social position. We have heard a good deal about the appointment of an assessor to act as joint architect, as in the recent Liverpool Cathedral competition—a principle certainly open to objection, except, perhaps, in that very exceptional instance. It is a question at least for the professional societies to consider to prevent its recurrence, and we are glad to see Mr. Woodward has brought up this question, which was discussed at the Institute last Monday. Many legal principles have now to be mastered. The conditions of contract is one of them—quite a modern necessity. The practical architect is required to be conversant with points of law; it is not enough that a lawyer draws up the contract between the parties. He at least is expected to bring his knowledge of the subject to bear; he has to instruct the solicitor as to what are reasonable provisions. In the majority of instances now the architect dispenses with legal assistance, and he draws up a contract according to the form that the R.I.B.A. has issued. For large buildings the form arrived at between the Institute and the Institute of Builders furnishes a good model to follow, with slight modifications where necessary. But there are not many in the profession who can frame a contract which will give satisfaction to building owner, contractor, and architect. The disputable questions which turn on such terms as the "reasonable satisfaction" of the architect or in respect of drawings and details afterwards supplied, as to the "true intent and meaning of the drawings and specifications taken together," as to "variations and extras," as to clauses relating to "defects," of the completion, suspension of works, extension of time, certificates, and especially as to arbitration, can only be mastered by a general knowledge of the law, and the decisions that have been given on these points. Another important question concerns Ancient Lights. We have lately given the gist of the Bill drafted by the joint committee of the R.I.B.A. and the Surveyors' Institution, and drawn some inferences with regard to it: but from the opinions we have heard expressed thereon the Bill has not given complete satisfaction. There are several interests concerned, chiefly the building owner, whether dominant or servient, the professions engaged, the lawyer, surveyor, and the public. These have all to be considered. The proposed measure will no doubt simplify the procedure, the lawyer will have less to do with the matter, the servient owner's interests will be guarded; it will not be possible, as it is now, to find one's light obscured by the erection of a new building without adequate notice and without means of redress; the position of windows and amount of light received will be recorded for the benefit of both parties, who will have access to the drawings; and the building owner will no longer be subjected to vexatious proceedings and the delay of building operations. These are decided gains. On the other hand, building operations will in many cases be prevented by the requirements, for there will be less uncertainty in the law, which have made it possible for building owners to try their luck, hoping by some legal point to escape the consequences. The action to be taken by the profession in certain cases of building and street improvements, such as that relating to the Strand and its northern line of frontage, in fixing upon sites for buildings of a detrimental kind in populous residential neighbourhoods, in the great housing question, and on other various matters about which the architectural profession as a body should have a voice, are questions that ought to be

discussed and agreed upon, instead of being left to individual opinion. Questions of taste are not so easily solved as those which relate to professional practice and conduct, or to public matters, or where the interests are so varied; but these all form part of the present-day equipment of the profession.

HOMESTEAD DESIGN.

THE architectural planning and construction of farm buildings is not, perhaps, a very attractive subject to the profession, as they generally associate the design of such buildings with the duties of surveyors of landed estates, and with experts who have made the subject their own. For some reason, the modern homestead is not a class of structure to appeal to our artistic sense; it is so essentially utilitarian that any attempt to make it architectural appears to be wasted labour. Why it should be so we cannot say, for as a matter of fact the old English homestead was often an interesting group of buildings which added immensely to the scenery of many of our country districts. The landscape painter loves to depict the old farmhouse and yard with its rural surroundings, and there is many an old barn to be seen in the Southern, Eastern, and Midland counties which has an architectural character essentially its own.

Mr. H. M. Cautley's paper on this subject, given at the Architectural Association last week, dealt chiefly with the practical side of the subject as it developed itself in the Eastern Counties. The type of buildings and fittings were of the simplest and most economical kind. The main essentials of farm buildings were sketched: as a good water supply (which our grandfathers provided by grouping all the buildings about a pond), a good metalled road close to the buildings, so as to avoid the expense of maintaining private roads—a serious yearly item. On arable land the buildings should be in the centre, or nearly so, as to save carting, and if the land slopes they should be placed on the slope to save uphill carting; but in dairy farms the buildings are better placed near the centre of pasturage, so as to save labour in driving and feeding the cows. As for aspect, "south with a touch of east" is the best for stock; when the homestead is on a slope, the buildings are best across the slope, to avoid steps. Other essentials are economy of construction and maintenance by the most labour-saving means; the most sanitary housing for livestock. Mr. Cautley does not give an ideal plan of a homestead; he rather naïvely distrusts the "model" farm building, which is often full of defects; but he thinks such a plan "will be found somewhere between the two extremes presented by the old-fashioned and modern or 'model' homestead." The advantages of both the ancient and modern plans are pointed out, and are worth quoting here. "In the old homestead there will generally be a large, rambling old barn of flail-threshing memory, with, perhaps, the cowsheds arranged about the same; the stables will be an entirely separate block, the piggeries in another, the granary, chaff-cutting house, and cartshed in another, and various outlying loose boxes and small cartsheds wherever there is an odd corner. In addition to this, the yards are nearly always of a much too large a size, rain-washed and wasteful of litter, all tending to the making of bad manure, whilst the aspect was rarely studied at all." The description is on the whole correct, though many of the old homesteads we know show that their builders were at least regardful of the latter point, and of the sheltering of their live stock. The conditions of the ancient mode of farming were so very different to the modern labour-saving plan, that we cannot rightly compare the plans on the same principles. Turning to the modern type, the

author justly observes, "All the buildings, even down to the fowlhouse, are grouped in one large parallelogram, the outside walls of which rise square and gaunt, with scarcely an opening to be seen." The author does not urge its ugliness, though he says that it is "the outcome of one of its most practical defects—viz., that everything is approached from within, frequently from internal roads and alleyways. Were it situated on some of our bleakest wold lands, I should find excuse in the pitiless winds and rains which drive across them; but why when on some sheltered hillside or sunny valley?" The plan does not save the roadways, it is urged. The few openings are distributed on all sides, and must have approaches, so the system is wasteful of cartways; nor does the author believe the modern grouped building is so economical, while the internal alley-ways require independent walls, and therefore do not save walling, and in case of fire the whole range is endangered. These, it must be confessed, are serious defects of the one large parallelogram plan. And the author points out, the deposit of manure in the small yard would be injurious to the health of the stock. Mr. Cautley said that in designing a homestead he would have as few internal approaches as possible; but that a common roadway should give access to every part; he would group the cowsheds, stockyards, and piggeries under the shelter of the barn and granary, keeping the horse yards, stables, and cartsheds distinct. The grouping of the sheds and stockyards would at least give a variety to the general composition that is so wanting in the "model" plans we have seen. While not following the rambling plans of the old homesteads, the architect, at least, can find opportunities for breaking his parallelogram instead of making the outer walls straight and bare. For instance, the cowsheds can be arranged to afford the best shelter or be placed against a barn, if the sheds are single lean-to's, for one row of cows. Several suggestions are given by the author on the details of planning a homestead, to which we refer the reader. In double byres or cowsheds the cows are perhaps most economically arranged head to head, with a centre feeding passage between; this allows the yards to be free for the disposal of the manure. The feeding passage must not be less than 3ft. wide, the manger will be 2ft. wide, the standing 6ft. 6in. from manger to edge of gutter. Describing other details, the author says each cow should have two bins, or four to each two-stall division, each holding a bushel, and the corner bin next division have a ventilating lid to hinge back—a plan which allows two feeds to be put in at the same time, and also permits of the cows being fed the first thing in the morning. The mangers should not be more than 1ft. 9in. in height and 11in. in depth, be made of 1½in. plank, the back plank being well canted. A support is required between the divisions. The remarks on the paving and gutters are reasonable; V-grooved bricks, with the grooves running in the direction of the fall are preferred, though a cheaper and efficient substitute is cement concrete finely faced. The sanitary authorities insist on open channels carried outside the shed, and the author proposes a stone slab rounded on the edge next the gutter. We quite agree with him that the standing for cows should be level in front of heelpost to manger, and should be of rammed clay or chalk. As to the question of open or covered yards, there is much to be said for the open arrangement; but modern farming and the use of cake foods have favoured covered yards, which prevent the waste of the manure by rain-washed yards, and the author allows 160ft. super. per animal, and good ventilation in the roof, which should be of a single span.

The old threshing barn was the central feature of the old homestead, but now super-

sed by the straw barn capable of holding about one day's threshing, and generally a two-storied building carried up the whole height, with 11 ft. high doors on both sides, that waggons may pass through the stockyards. Here the homestead architect may display a little honest art in making it a central feature, with stockyards sheltered by it on south side, and stackyard on the north, while its direction should be east and west. A floor of wood or the sawn-off butts of felled trees is perhaps the most desirable. The design of the straw barn should be simple, and honestly express its purpose. The high, large doors for waggons can be made a feature by gabling the sides, and the ends of barn, with the openings or doors high up for passing the threshed straw, can also be made to aid in the external effect. Next the food stores, the root store and mixing floor, with the preparing floors over for the crushing machine and chaff-cutting, form another tolerably high range of buildings which can be treated in connection with the barn. In these essentially utilitarian buildings it would seem that there is little opportunity for design; but a true sense of their fitness, accompanied by an artistic instinct, can turn them from uninteresting and ugly into plain but effective structures. Thus the doors of the root store and adjoining mixing floor must be necessarily large for carts to be backed in, and these openings can be treated with a little more emphasis than they usually receive. The tile roofs should have good eaves, and ventilators of a simple, inexpensive type should be used over the main sheds. Then there are the cartsheds, which may face north-east. Simple as these are, they add to the variety of the grouping. These should have openings not too high, about 8 ft., and about 9 ft. wide, so as to exclude the rain; and the proportion of these openings, together with the brick piers and wood posts and the tiled roofs, can be made to form useful boundaries of the yards and shelter them at the same time. The designer of such buildings must try to divest his mind of the hopelessness of making them agreeable; too often he dwells on their intractable, matter-of-fact nature, and arranges them according to a model, quite regardless of appearance, whereas if he had taken a little trouble in grouping the buildings, following as far as he could the old type of homestead, and using local materials in a manner to impart variety in design and colour, a far more agreeable result might be achieved.

In various volumes of the BUILDING NEWS we have given plans for farm buildings and dairy homesteads, based on modern experience, which may be taken as models of good planning; but there is room for improvement. The architect has not taken the problem into his earnest consideration. Generally his want of knowledge of agriculture, planning, and details of such buildings has deterred him from attempting to improve the "model" plan. The competitions for homestead designs have generally fallen into the hands of experts, and the selection of designs submitted has been invariably made by those who have a practical knowledge of the details of homestead planning and construction, but who possess little architectural skill. It does not follow that because a man knows little of stock or dairy farming or details he is unable to modify or rearrange a plan of such buildings, or to present them in a manner that is more artistic—presuming, of course, that he does not violate any principle of good homestead arrangement.

A new school was opened on Friday by the New Monkland School Board at Gain, near Gleubog. The school, which affords accommodation for 120 pupils, has been built to a design by Mr. John M. Arthur, architect, Airdrie, on a site immediately adjoining the old school, which it is proposed to take down.

TWO BENCH-ENDS, ST. PAUL'S CHURCH, JARROW-ON-TYNE.

THESE two poppy-head seat standards, with their elaborate traceried ends, are from the choir seats of this church in Durham, and are drawn by Mr. Edward Cratney to scale, with sectional details of the mouldings. The work is in oak, and in good preservation.

THE RESTRICTIVE BUILDING CONDITIONS OF THE COUNTY COUNCIL.

AT the auction held in October last certain valuable building plots in the Strand, Kingsway, and Aldwych, on the Strand-to-Holborn thoroughfare, were offered on lease, but

no bids were made for them. In consequence of this fiasco, the Corporate Property Committee of the London County Council have been considering whether the building conditions relating to the leasing of the Council's surplus land acquired in connection with various improvement schemes should be modified with a view to the letting of the land more expeditiously. As the conditions stand at present, there is no provision made for arbitration. One of the conditions provides that in the event of any dispute arising between the Council and the lessee in connection with the erection of buildings, such dispute is to be settled by the Council's architect, whose decision should be final. The committee have now reported to the Council that they are of opinion that, although there were no bidders for the plots of

land in connection with the Holborn-to-Strand improvement at the last auction, the Council would not experience any difficulty in eventually disposing of the plots under the existing conditions. They were, however, impressed with the desirability of securing a speedy recoupment in connection with the improvement, and they thought the Council would be well advised to make some concession so as to facilitate the letting of the surplus land. They accordingly recommended:—"That the building conditions attached to the leasing of the Council's surplus lands in connection with improvement or other schemes be modified so as to include therein the following provision:—If, and so often as the same shall happen, any dispute shall arise after the plans and specifications have been approved between the Council and the lessee as to any matter connected with the erection of the said building or buildings, or the foundations or drainage thereof, or the preparation, laying out, fencing, or otherwise dealing with the said land, which matter is not provided for by 'the approved plans and specifications,' or any additions to, alterations in, or omissions from, the same authorised as aforesaid, or by these conditions or conditions of approval, every such dispute shall, if the parties do not agree, be decided by an arbitrator appointed by the president of the Royal Institute of British Architects, whose decision shall be final." This report was adopted by the Council on Tuesday.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS' BUSINESS MEETING.

LORD BALCARRES, Junior Lord of the Admiralty, and Lord Windsor, First Commissioner of Works, were elected Hon. Associates of the Royal Institute of British Architects on Monday last, when Messrs. Llewellyn Kitchen, Brook Taylor Kitchen (architect of the Local Government Board), Sydney Perks, Basil A. Slade, and Melville S. Ward were elected Fellows, and twenty-two gentlemen were elected Associates; Mr. Charles Follen M'Kim, President of the American Institute of Architects, being elected Hon. Corresponding Member. The results of the November Examinations were announced as follows:—146 students passed in the "preliminary"; 53 in the "intermediate"; and 22 in the "final" examinations. Five Probationers were exempted from examination, and were admitted as students.

LIVERPOOL CATHEDRAL COMPETITION.

The interest of the meeting centred in the two resolutions of which Mr. William Woodward had given notice in respect to the late competition for the new Cathedral at Liverpool, and, as might have been expected, the topic furnished material for an animated discussion, in which Messrs. A. W. S. Cross, H. T. Hare, Leonard Stokes, John Slater, E. T. Hall, T. E. Colcutt, Maurice B. Adams, John Woolfall (President of the Liverpool Society of Architects), S. Vachar, C. E. Hutchinson, E. W. Hudson, T. H. Watson, and others took part. The President, Mr. Aston Webb, with considerable tact and discrimination, kept the speakers to the points at issue, and went far to bring to an amicable conclusion what might otherwise have easily digressed beyond reasonable bounds. He alluded to the fact that so far as the appointment of the assessors in this case was concerned, the Institute was not consulted, so that in that sense the Council could not take any direct action in the matter, though he, personally, had not hesitated in his Presidential address to express an opinion as to the undesirability of a precedent being established in respect to an assessor consenting to act as joint architect with the author of a design chosen in a competition with which he had been so associated. The meeting was unanimous in supporting this view of such appointments, although it was explained that in this particular instance Mr. Bodley was told by the Committee unless he, and no other architect, agreed to co-operate with Mr. George G. Scott, the latter would not be employed to carry out his design. Therefore, to secure to him the result of his success, Mr. Bodley had, under great pressure, resolved to accept the position. Mr. Woodward, on this assurance, at once gracefully withdrew his resolution, which was as follows:—

"That this meeting views with the greatest disapproval the action of one of the assessors allowing himself to be associated with the selected competitor in the carrying out of the work."

In introducing this resolution and the one

which preceded it, Mr. Woodward manifested the utmost fairness, and carefully excluded all personal allusions other than those of an appreciative character in respect to the personality of both the assessors, Messrs. Norman Shaw and G. F. Bodley, and he warmly commended the skill and architectural merit displayed in Mr. Scott's design. The previous resolution was to this effect:—

"That this meeting condemns the action of the assessors in giving the first place in the final competition to a set of drawings which did not comply with the essential condition of the competition."

An epitome of the history of the competition was furnished by Mr. Woodward in bringing the question before the meeting, and he read extracts from the official conditions issued to the competitors in the final contest; but it appeared during the subsequent proceedings that that part of the instructions dealing with the provisional central preaching area to seat 3,000 in view of the pulpit was embodied under a suggestion on the part of the promoters, instead of being a precise condition or instruction, although it is quite clear that the committee had so intended such a central area to be provided, because on the receipt of the referee's award the committee rejected all the designs on the ground that Mr. Scott had not given such an area. This decision was reversed on the advisory architects explaining the error into which the committee had fallen, seeing that the question of a central area at the crossing of the building had virtually been left as an open question at the option of the competitors. Thereupon the committee decided to confirm the award, and Mr. G. G. Scott was approached as to his appointment being made conditional with the election of Mr. Bodley as consulting architect with him. Mr. Scott acquiesced without any reserve, as he explained in a letter addressed to the President and read by him at Monday's meeting. The following particulars, communicated to us by Mr. Bodley, and published in the *Building News* for July 24th last, give a confirmation of the correctness of this account of what happened:—

"When it was ascertained that the author of the selected design was Mr. Scott, a young man of twenty-two years of age with no practical experience of building, the committee naturally felt great hesitation in placing so important a work in his hands. They at first decided to abandon the result of the competition altogether; but, under the influence of strong representations from the assessors, they afterwards reconsidered this decision, and invited Mr. Bodley to act as joint architect with Mr. Scott. This Mr. Bodley at first declined, but expressed his willingness to become 'advisory' architect. The committee, however, would not agree to this suggestion, and it was plainly intimated that, unless he could see his way to taking the position of joint architect, Mr. Scott's design would be definitely abandoned. The situation thus created was a most difficult one, and in order to insure that substantial justice should be done, and that the competition, which had entailed so much thought and labour, should not prove abortive, Mr. Bodley finally agreed to the committee's wish, and became joint architect, a position which, however, he had neither sought nor desired. The publication of these facts will probably remove a good deal of misconception."

Mr. Woodward said he was cognisant of this letter, but that it did not convey to him the more definite reason which transpired during Monday's debate that the committee would not agree to appoint another architect to be associated with Mr. Scott instead of Mr. Bodley. The two resolutions were, in their subject matter, so intimately connected that it is not easy to separate their consideration in a descriptive report of the proceedings. In point of order they were taken separately in a business-like way, though necessarily the discussion overlapped. One definite issue was at any rate established, and in this the only practical result of the meeting may be said to consist—viz., that the members were unanimous in insisting upon assessors adhering more precisely to the plain interpretation of clear and definite conditions issued to competitors in all competitions than they have frequently hitherto done. It is folly to expect a loyal submission to the awards of referees, whether they are nominated by the Institute or not, if awards are made without a strict compliance with the rules of each particular competition, and also in agreement with the further instructions furnished by the questions of the competitors, and the official replies thereto. It is beyond question that of late instances directly in violation of such reasonable considerations have occurred, and we can hardly imagine anything more likely to bring the whole practice of architectural competition into disrepute than such conduct on the part of assessors, no matter how eminent they may happen to be in other respects. It will be useless for the Council of the Institute to expect compliance if such

irregularities are not dealt with as they deserve, without hesitation or personal considerations. The assessor cannot shield himself behind the dignity of his office by generalised assertions that no one who has not had the advantage of devoting as much time as he may have done, with all the drawings and papers before them, can form a proportionate opinion as to the merits of each particular instance. In the abstract this may be true, but in the cases present to many minds a very brief study of the premiated plans enabled a practised eye to discover manifest discrepancies which an assessor ought to have at once detected, while the competitors who had devoted as many weeks as the assessor has spent hours upon the problem in question realised no doubt whatever as to the injustice of premiating and selecting plans which fairly and squarely in matters of fact, and not on points to be determined by opinion, were at variance with the rules laid down. Sometimes assessors have been elected to judge in competitions for specialised buildings with which they have no personal acquaintance, and in others men are elected assessors who have themselves built nothing of the kind. No one doubts the difficulties which all assessors frequently have to deal with, and naturally there can be only one architect thoroughly satisfied with their awards—namely, the selected man; but the taunt that it is unsportsmanlike not to accept the fact of being beaten falls very short of the mark when the game itself is conducted in defiance of the rules, not only by competitors, but, above all, by the umpire. One of the speakers asserted that the whole of the Institute was in agreement with the conclusion as to the conditions of all competitions being rigidly adhered to; but in practice there has been too much laxity in this matter, so that if the debate leads to a more strict observance of this conclusion it will not have been in vain. Mr. Woodward's first resolution did not come to the vote, because an amendment was carried that the meeting proceed to the consideration of the second resolution. It may be interesting to add that the President of the Liverpool Society warmly supported the action of the Cathedral Committee, and explained that during the interval between the first competition, when Sir William Emerson's design was selected, and the last competition, almost all the original promoters and promised subscribers had died, and the site then contemplated had been lost. He approved of the course followed in the subsequent proceedings, though he added, "We all thought there were men in Lancashire equal to the task of being associated with Mr. Scott," and he mentioned Messrs. Austin and Paley. In respect to the statement in Mr. Woodward's first resolution as to the essential condition of the competition, by which he referred to the central preaching area, it is a notable fact that all the other designs did comply with this "suggestion," while three out of the five made it the governing factor in their plans, and two specially treated their particular arrangement of it with much architectural skill. We have only to add that while no one doubts the sincerity and integrity of Mr. Bodley, and while few would hesitate in saying that, under the circumstances, he did the best when he agreed to the proposal of the committee, it is none the less clear that the other competitors might have equally well succeeded if Mr. Bodley had been associated with them; and so the matter stands.

The various designs for Liverpool Cathedral were illustrated in the *Building News* for May 29 (when we gave the selected plan), June 5, 12, 19, 26, July 3, 10, 17, 24, 31, Aug. 7, 14, and 21.

SOME THOUGHTS ON ARCHITECTURAL DESIGN.*

OF architecture as an art I would speak. We may, for the nonce, pass over the many and varied aspects of our professional work that exacts all too much of our daily attention in the ever-taxing fields of everyday practice—aspects that loom large, too often, in the exigencies of many a narrowed sphere, and tend to obscure the larger hopes and onlooking towards the greatest and truest work of the architect. All great art is the same at its source of inspiration, and only uses technical methods for its proper and fit expression; the musician his instrument, the painter his brush, the orator his language,

* A paper read before the Royal Victorian Institute of Architects by ROBERT J. HADSON (F.), F.S.A.I.A., Architectural Lecturer, Working Men's College, Melbourne.

and the architect his pencil and his material. It is clear then, at a glance, that architectural design is not begun and ended upon paper, drawing being only a necessary means to an end—a way of expressing ideas that may be solidified in the building. So that drawing is necessary, and technical knowledge is more necessary, and clear and precise experience of the uses and limitation of available materials is necessary, and, coupled with them all, a clear and practical acquaintance with the capabilities of the local artificers who are to carry out the building work is necessary. And first, as to the source of true art. Where shall the architect seek for those powers that shall make him a master of architectural design? I would not set a limit to any man's field of education, for who can know the secret sources of another man's inspiration—of the powers and influences that have made him? True it is that no man is made in a day, and perhaps not in a generation, and even at the back of our investigating we are confronted (often against our will) with the dominant fact that the gods give to whom they will—some to be technical plodders, some to be mechanical constructors, and some to know the mystery of beauty and to express it in the solid stones. I can only give my own thoughts, and you can in the criticism, I hope, give yours to correct my errors. Let us then seek ever the inspiring power of Nature, and of the old architecture, for it is art we seek. It is popular to ask, "What is art?" and to expect that the answer could be given in a word as easily as the question. But art, like all great things, cannot be explained in a word. "What is truth?" is easy to ask from Pilate through all the ages; but who has answered the question? And "What is art?" is the questioning inquiry of aesthetic thinkers through all the years since our savage progenitors scratched their rude pictures upon the primitive rocks. But what is art? The tangible expression of an artistic idea. And who are artists? Those to whom the gift has been given of reducing to solid being and expression the ideal of beauty of form, colour, and sentiment that find their echo and appreciation in the minds and emotions of those who, in a degree, are like-minded. It is at the source we need educating—the development of the soul, the creative instinct, the vision-seeing Ego. For in so far as we are true to that, so is our work good, worthy of the appreciative thought of others, and worthy to remain. But when we yield to our banking account and the commercial spirit of the age, we fail. A man whose work is never greater than the regulation 5 per cent. upon the outlay will never be a great architect. I am aware that this is an uncommon way of giving "Thoughts upon Architectural Design," and your minds may revert to the old training course of drawing from the cast, studying the antique, measuring old work, office practice, knowledge of materials and construction, and skill in geometrical working drawings; yet you must be aware that a man may have all these things and yet not be a designer. Knowledge of a keyboard does not make a musician, nor knowledge of a colour-box an artist; and there is another thought that would appear at first sight to be a somewhat discouraging one to our students: we like to think that hard work and application will win all, but experience tells a somewhat different tale. The designer is more often than not born, not made. He holds the gifts of the gods. Develop that gift he must, or he fails; but when developed his one stroke will have more power than twenty strokes of the other man. And so it is of all the arts: the gods give to whom they will, which is a mystery we know not of. And secondly, as to the designers' outlook. We live as architects essentially in a commercial age, and to live must needs in a measure conform to the spirit of the age, lest we become obsolete and be carried away on the tide—the rushing, resistless tide—of popular demand, and be lost. We can, in a great measure, and we should, I think, be true to Art, and yet true to our own age. Architecture has fallen! And why? Because she has been too much the copier of dead forms that have had their day. Not for a moment would I think less of the classics, but we need not in our day the dead forms of dead men, but the living, vitalising expression of live men's ideas. The old designers were true to their own age—let us be true to ours. We copy the old work too much—no, not too much, we can never go over those lines of truth and beauty too often; but we linger too long—we stay when our own stroke should be made, too timid, too overawed by what we have seen to trust ourselves. It

would be presumptuous, we think. How can we hope to do anything but copy? But the man who fails after careful study to dare to put down his own line, however unsteady that line may be, is lost as a designer. Art needs the stroke of every true man's pencil, the courage of every individual's personal expression; and until she receives that our designs will be commonplace, dull, uninteresting, and merely the echoes of the thoughts of others applied to the problems of other days—needs that have in a great measure had their day and ceased to be. The design problems of our day are not the problems of the past, and no wise man will seek to answer to-day's questions with last century's practice, save that history and experience may help him to the better understanding of his task. Think for a moment of the difference of our architectural needs. Greek Art was perfect in its way, but its sphere was very narrow, and was limited by a one-story temple. Rome, with all her gigantic architectural and engineering works, had no need for the great office buildings, so vital a part of every modern city. And Medieval life, quaintly seen from the distance of time, produced the Baronial Castle Fortress, but little needed in these days of popular liberty. Religious architecture, of all the arts, clings most perhaps to its traditional past and ancient forms, and therefore can be the more used in the present, save that in the modern ritual there is more of preaching and less of ambulation, which would almost appear to demand the removal of the column in the body of the auditorium of modern church buildings. In this connection we should, however, remember that great design has in it many of the attributes of the gods common to all times, deep with a sense of fitness, and wide with a universality of beauty. And thirdly, as to the designers' actual work. A word should be said about style. As experience grows upon the mind, one is more inclined to pass aside those fixed ideas of working in one distinct style that fasten themselves so closely around the student mind as being the right and proper sphere of the designer. In this thought we break away from one of the very strongest traditions of our calling, and one that has doubtless led the profession into the danger of being the progenitor of dead forms—a profession without vital and progressive life. Some men follow a school, and find strength in banded numbers working upon similar lines—that is well. Others are strong in individual strength, and dare to be original, and that is better; they are the founders of schools. My plea is for each building to be considered purely upon its own merit, without bias or prejudice. In method of work I have seen the value of what may be called the "modelling mind." The "modelling mind" is not the perfecting of a plan or a series of plans of the intending building, but the gradual and altogether building-up of the design as a whole in the mind, and if you will, upon the paper. The clear working out of mass as to convenience, height, comparative position, elevation, skyline, construction, material, colour, and the rest. There is common belief that anyone can make a plan, but a designer is required for the elevation. Gentlemen, I take it a designer is required for the whole, and when a design is thus conceived one can no more take from or add to it than the artist painter can obliterate some part of his work upon the canvas without destroying the harmony and balance of the whole picture. While in this attitude of mind it is well to remember a few main principles:—Seek truth. Be true to your materials. Study mass. Let Nature do all she can with the exteriors with her sunlight and her shadows. Study colour and its harmonies. Know the un-failing value of a plain surface. If you ornament, know the value of clustered enrichments. Never be afraid of simplicity. Thread something through the whole, like one finds in great music and great painting—a touch of life that makes the whole akin. And when the design is completed, and properly and practically expressed by scale drawing and details, and explained by complete specifications, have tenacious belief in it, and swerve not from the definite purpose that it be carried out as shown. Nature is always teaching us something about *line*, and this of itself is a fascinating study that we may note in passing. There are lines that express all the various sentiments and emotions, such as dignity, solidarity, movement, true balance, aspiration, mystery, rest, and so on, and these the designer plays upon. In church design he needs very specially the vertical line, the clustered length of upright

pier, the mystery of narrowed interlacing traceries, and dimness of lofty roof, so charming in the Gothic. In the house design, the line of rest is best introduced—the horizontal line—the line we find in nature most often by the placid waters of broad rivers when the sun is low. Let repose prevail, and while seeking stateliness in the larger houses, and especially in those parts of the house more specially built for entertainment, see to it that in the living-rooms the level line be much seen. In public and semi-public buildings the play and effect of large dignified masses may be best seen aided by substantial materials. Our present-day Australian practice presents many peculiar and interesting difficulties. There is climate and available material—let us be true to both; and available funds as well, an all-important question, but one that is perhaps in very many cases made too much of a difficulty. To limit a man in price and materials in some degree is not, in my opinion, so great a disadvantage as some may suppose. No doctor declines a case because it is difficult; no lawyer worth the name refuses an opinion because his clients' interests are closely beset with difficulties; the greater the narrowing, the greater the skill required by the designer, that is all. With the finest of materials a poor designer will fail, and of that we see ample proof in every city, and ample in our own. One cannot say too often, "The well-designed building need not cost a penny more than the badly-designed one," and there is very ample need to lay firm hold upon this, for prejudice is intensely strong. And there are many other thoughts that crowd in upon the mind in a subject such as this; but there is now no time to dwell upon them. I know it is popular to be pessimistic about Architecture, to deplore the death of Art; but while the great mass of the work of to-day may be passed over with some regrets, there is reason to believe that the sacred flame of True Art has not been allowed to entirely die out. We know that the mountains are strewn with jagged rocks and barren stones, but the beautiful flower is there in the hidden crevasse. Gentlemen, let us seek it, cherish it, and work in hope.

BUILDING BY-LAWS REFORM ASSOCIATION.

At a meeting of the council of the above Association, at 45, Parliament-street, Sir Wm. Chance in the chair, the following resolutions were passed unanimously:—

1.—(A) That a By-Laws Committee, to consider and report on the amendments needed in the existing Building By-Laws be, and is hereby, appointed, consisting of the following Members:—Mr. W. M. Acworth, Lord Robert Cecil, Mr. A. H. Clough, Mr. A. Graham, Mr. W. H. Heman, Mr. Mark H. Judge, Mr. E. L. Lutyens, Mr. Arthur Newbold, Dr. G. V. Poore, Mr. H. A. Powell, Mr. Lacey Ridge, Mr. R. W. Schultz, Mr. J. St.-Lee Strachey, Mr. E. D. Till, Mr. Thackeray Turner, Mr. C. Turner, Mr. H. G. Willink, The Hon. Percy Wyndham, together with the Chairman and Honorary Secretary.

(B) That the Report of the Special Committee appointed on May 14 last, as adopted by the Council, be referred to the By-Laws Committee with a view to the work being continued on the lines therein laid down, especially as regards the following points:—

- (i.) For the purpose of securing, with as little delay as may be, some relief from the more oppressive of the By-Laws now in force in rural districts, the Committee to approach the Local Government Board and endeavour to secure their publishing a new set of Model By-Laws for these districts, embodying amendments which the Committee may suggest to the desired end. Further, to urge District Councils to amend existing By-Laws accordingly.
- (ii.) Following on the above, to prepare a set of Draft Building By-Laws carrying out the recommendations of the Special Committee that "the by-laws should lay down principles," and that "each by-law should provide that, unless the principle it enunciates is otherwise given effect to to the satisfaction of the local authority, it shall be considered to be given effect to if the requirements set out in the schedule to the by-law are complied with."
- (iii.) As soon as practicable, to deal with the by-laws of urban districts in like manner.

2. That the above resolution be forwarded to the members of the Association in a circular letter requesting them to inform the By-Laws Committee of any cases of hardship under existing by-laws, and asking them to make the Association known to their friends, in order that the number of members may be increased as much as possible before the annual meeting in February next.

On Saturday night a fire broke out at 7, Wormwood-street, City, a building of about seventeen rooms. The occupants were Messrs. R. Storey and Co., timber merchants, Mr. E. E. Niblett, architect and surveyor, and other firms. The building and its contents were seriously damaged, and the caretaker's wife lost her life.

A COMPARISON OF ENGLISH AND AMERICAN METHODS OF THE ERECTION OF BUILDINGS.*

By CHARLES HEATCOTE, Architect, Manchester.

I AM not dealing closely with the constructional designing of buildings, although that has considerable bearing upon our subject, but with the methods adopted by the erectors of the work. In the Press or elsewhere, only one superiority in building matters has been claimed by or for the Americans—the claim of speed. In the most picturesque of the Press comments no claim has been put forth for better work, better finish, less settlement of walls, less cost, or any other advantage over the English contractor than the one of acceleration of speed in the erection of the work. It is an important claim, however. Is it a just one? In my opinion it is, only qualified by the remark that, all other things being equal, it has been an exaggerated claim. What are the methods adopted by the Americans which are not in general vogue with English contractors, whereby this acceleration is obtained? Several factors are necessary, and in a parenthesis it may be added that there are many Englishmen possessing every one of them, who have worked with them in full play, achieving much, although, like Englishmen, they have done so quietly, quite oblivious of the fact that they were doing anything deserving special comment or in any way out of an ordinary, quick, bright, business life. But my point is that these speeding-up qualifications are not as widespread amongst us as with the Americans. Again cautioning you I am only referring generally and not individually, let me come to the "practical politics," and give you a summary of these

FACTORS OF SUCCESSFUL RATE AND PROGRESS.

The American is:—Firstly: More keen upon his work than we are. Of him it cannot be said, as of some Englishmen, that his business occupies his spare time. It is more true of him than of us that business comes first and pleasure afterwards. Secondly: The American architect is more generally alive to rapid completion of the drawings and details of the approved scheme in order to enable the contractor to know at the start virtually the whole of what he has to do. He also, if the work is such that it can be introduced, schemes his construction in such a manner that quick speed is attainable. Coupling-up steel stanchions tends to more rapid progress than endeavouring to provide polished granite from a Scotch quarry in winter. Thirdly: Based on being provided with the drawings, the contractor is enabled to perfectly organise his work. Every contractor here will know the extreme benefit and help this is to him, and would appreciate being always provided with early full settled information, clear and definite. Fourthly: This is one of the principal factors. Why should American architects work early and late, employing wider assistance to enable them rapidly to complete their drawings and instructions? Why should the American contractor spend much more on superintendence, on labour, on overtime, on earlier delivery of material? They do it because the American proprietor, more fully appreciative of the fact that the rapid building of his works means money to him, is willing to pay the necessary additional expense such services involve. It is a pecuniary advantage to him, and he does not hesitate to pay in order to gain it. By his paying for it the costs of the acceleration are met, and the incentive provided for the greater exertion on everyone's part. Fifthly: The American values more the power of work in his employes than the amount of minimum wage, and to save time will more eagerly seek the latest hoisting and other machinery. The attitude of the working man is also in his favour. An American workman seems to recognise that the more cheaply an article can be produced through economising labour the more the trade as a whole will be benefited, and, as a natural result, the labouring classes must be also. I have seen the matter put thus: "We know we are the gainers in the end if a new machine is introduced which does the work of ten men by the help of one. American employers always pay better wages to the men employed in their labour-saving machinery, and this has a tendency to advance wages all round, and find more and more employment." On the other hand, it seems to be the

deliberate policy of some trade unions in our country to compel their members to do as little work as will pass muster. This is a hard saying; but letters to this effect to the *Times* failed in getting any denial from the Union leaders. I should like to know this was a mistaken impression. It does not obtain, however, so much in the provinces at the present time. In this summary you have the whole matter. It is application and devotion to work, with profit as the incentive and reward. Let us deal with these

FACTORS IN GREATER DETAIL.

An American is keenly alive to the necessity of work, thought, and application in his business. He commences his business education early. The system of education of the youth of America is founded more with the object of the ultimate business-life than is ours. It is of more importance with him to know the history and to study the causes of American industrial progress than to be imbued with the knowledge of a dead language. He is in his early manhood being properly fitted for his career, and his interest is thus bent towards his business pursuit. He has every opportunity for being trained in the right direction. Technical education implies in teaching some concern for the practical prospects of those taught. Practical experience goes with the theoretical. An American, by a common-sense education, does not enter upon his trade with a suspicion that he is demeaning himself. Hopeful enterprise is the spirit in which he begins; he believes in the thing he has to do, and is proud of it. Can this be said to be the general drift of our higher educational systems at present? It must be remembered America is a huge new country, and for a century there have necessarily been continually new developments, widening industries to meet the needs of an increasing population still further enlarged by constant immigration, and consequent urgent demands in ordinary times for labour and material of every kind in building operations. These young industries were fostered by Protection. The price of the nation's manufactures and the wages of the people continually increased. The cost of home productions being thus generally enhanced, the absolute necessity arose for the seeking and adoption of every feasible method for the reduction of that cost if trade were to be increased at home, and still more if there were to be any weighty business in exporting manufactured articles to a country where Free Trade at any rate kept down their cost. Necessity was again the mother of invention. The natural outcome with an energetic people was the introduction of labour-saving machinery. For this competition labour-saving machinery was not the only thing needed, but improvement in the manufactured article where such could be obtained. The necessity found the incentive and motif, without which nothing important will be done. Similar results follow here where necessity has driven home the incentive. For the moment some of our trades have been overtaken, but in many all efforts have been in vain to exceed the excellence of our manufactures. Great Britain is still easily first in certain textiles and textile machinery. No other country can approach the productions of Lancashire and Yorkshire. Recent indiscriminate eulogies of almost everything foreign compared with our own work and methods have given a very erroneous impression. It has become the fashion to depreciate ourselves until people are beginning to believe it. An American, on the other hand, makes a point of praising his own country on every possible opportunity. We seem almost eager to belittle the industrial efforts of our island. We are unjust to ourselves. The products of our great Yorkshire mills are not equalled anywhere in quality and finish. Our carpets, our cotton, our cloth, the precision of our machinery, our shipbuilding, our pottery, our cutlery, are still unbeaten. Abroad our goods hold their own in quality and finish, although in some directions there is certainly great need for new ideas and improvements of design. When staying at one of the New York largest modern hotels, I was much struck with the beautiful finish of the bath and lavatory appointment and general plumbing work. Being naturally desirous of gathering information wherever possible, I asked for the name and address of the firm who did the work, intending whilst in America to visit their establishment to see their goods. The whole hotel, it turned out, had been fitted by a London firm. If this had been reversed every newspaper in England would

probably have contained an article upon American enterprise, with gushing accounts, possibly paid for, about the decadence of the sleepy English sanitary engineer before the young American invader. Gentlemen, in matters of self-advertising we are as Babes-in-the-Wood compared with our cousins. This method, at all events, is totally opposed alike to the sentiment of Englishmen and the better class of Americans.

INCENTIVE THE LEVER OF REAL PROGRESS.

It has not been very strong with us. The supremacy of our old country for many years in manufactures, industries, and wealth seems to have induced in us the habit of thought that we were by nature and a good providence the only possible first; that our very success indicated there could hardly be room for improvement; that what was good enough for our fathers and made their fortunes was good enough for us, who were doing very well, and there was no apparent need for strenuous endeavours for other methods, increased knowledge, and new markets. But for those wishing to compete with us, and to effectively attack our position, an opposite state of things obtained. Their necessity, circumstances, and environment have called forth increase of energy and application, whilst we have been in many ways generally content to remain as of old, having formed our habit of believing we were unassailable as the workshop of the world. But this is quickly changing. The working force does not appear to be a matter of race at all. A Britisher going to the States soon adopts the quicker actions of the country, and overcomes the conservatism of his old ways. The best brickwork, for instance, in New York has been done by English bricklayers. There is no one definite reason that can be given for this quickening of activity. The work is done under a different organisation, and follows methods of economising human labour. These combined, when acting in conjunction with exactly similar machinery to ours, produce a greater result. And the workman himself recognises this. Americans have some methods ahead of ours; but in other ways they have as much to learn from us as to teach. There is this great difference, as I have been endeavouring to show, the greater desire to learn, and to take advantage of what they see to effect improvements in their work and methods. They are, in a word, more keen to find out and adopt good new ideas, as they appreciate it is to their all-round advantage to do so. And if you find on one side a young man imbued with this spirit in his business, and on the other one who does his work more as drudgery, with an eye to leaving it behind at the first moment, which is likely to gain the business, other things being equal? Excessive railway and canal charges may have been in our island largely responsible for decline in some trades; but there have been causes of deeper significance. Have the sons and successors of the founders of many of our industries generally been actuated by the genius, pluck, and untiring energy of their fathers? The inducement was not there for the same old strenuous life.

We have everything in our favour if we will but overcome our old self-satisfied conservatism of thoughts and methods. The English quiet, self-respecting determination, coupled with keenness for quicker work and better organisation, is all we need. It is not entirely the highest speed that is wanted, but the old good workmanship, better speed and progress, well-organised methods. I was recently asking an Englishman, who had lived twelve years in Melbourne, his opinion of American competition there. He illustrated his answer by saying if one heard of a good prospecting locality and went to see it, one would be sure to find either a Scotchman or Englishman there already, pegging out claims; but if one went into an ironmonger's store, probably half the goods would be American, the remaining portion being English of the same pattern exactly as ten years ago, strong and durable as ever, whilst the American productions of the same class, not as strong and durable as the English make, but improved in style and pattern two or three times in the period. This illustration very clearly explains our respective positions. There is not the remotest claim that American buildings are better built than ours. Work rushed by flares and at night, for instance, cannot be as good as that accomplished by daylight. I am a believer also in the sober section of our working men and women, whose skill has no equal, and I very much doubt if in times of stress and difficulty their quiet, determined courage has, either

* Lecture given at the Society of Arts, London, December 1, 1903, to the Institute of Builders, Mr. William F. King presiding.

In some sections of industrial activity it will be very difficult to regain our former position, and it will only be accomplished by long, patient study and application. But it is not only this in many cases. I am thinking at the moment of the chemical industries. The German manufacturers are said to have succeeded in obtaining a wider grasp of this business than would have been possible if we had had the inclination and the foresight to have provided thorough training easily within reach. But our patent laws are answerable for a great deal of it. Every other nation but ours makes it conditional to work or license a patent if granted in their territory, but we allow a patent to be taken here without this. Although aniline dyes, for instance, were first made in England, the effect is that Germans patent their chemical improved methods in both countries, working it in their own country and stopping anybody doing it here. Surely such a law should be altered if we complain about bad trade. We are deliberately helping the foreigner in many cases against ourselves. There are scores of inventions made by Englishmen thus patented, and credited to other peoples by the action of these patent laws, and among them many connected with the building trade. This is my excuse for naming them. Even the most fiscally-upsetting Conservative or the most commercially-reposeful Radical could not object to freeing us from such prejudices as are contained in our present patent laws. There are more drones here than in the American hive. This is not very healthy if we are to retain our position. The only way to effect an improvement is to provide inducements. A young American will work and study in his business because he is assured of remunerative employment at the end of it, and the more he knows and the smarter he is the better he will be paid. That inducement does not hold good here to the same extent. If a man is a labourer he will not be allowed to lay bricks, however clever he may be at it, until he has served many years of apprenticeship. What inducement then has he to learn to lay bricks? Further, are our new magnificent technical schools filled with eager youth striving to extend their knowledge in the particular line of their calling? Many there are who industriously and commendably apply themselves to it, but there is not the eager, hearty entering-in of the great mass of the people, because the inducement is not there. Can the desire for knowledge of building construction in the average builder's clerk be compared to his anxiety for a football match?

THE POSITION AND WORK OF THE ARCHITECT.

The second factor mentioned was the great body of architects are greatly interested in their calling, and are keen in their business application, with great capacity for work. They possess, among other reasons, a strong inducement for the due fulfilment of their duties in the fact of the fascination and joy in the work itself. But we have not, as a body, sufficiently risen to the fact that a month saved in the preparation of drawings and data probably means a month's interest and a month's profit to our clients. We have not also as a body sufficiently educated ourselves in modern advance in those forms of construction and the use of materials leading to saving of time with its attendant advantages. It is not fair to a contractor ready with his plant, his office, his desire to please, to be hampered in his progress by want of drawings, which are his illustrated instructions, his directions. He is a wise architect who will learn that by saving time he is assisting his client and strengthening his own reputation. I am fully aware of the delicate ground I am now crossing. There are many men in my profession as much to the fore in all this as any American, but it is not the average; and in speaking of assisting the speed of execution, I am as fully aware as anyone that speed is not everything, that in some cases it is a distinct disadvantage in construction and stability, that there are circumstances in which it would be decidedly detrimental to the structure and averse to the interests of one's clients, and in other cases it would be impossible to build quickly, but as a body we do not furnish the contractors as quickly as we should with the drawings if we are expecting him to exercise all the skill he can in forwarding matters. I once knew an architect who obtained estimates for ten different designs for a dining-room dado before he could decide up his mind, and I have no doubt many in this room could give some amusing anecdotes of a like character. Further, we in England,

architects and builders, do not as fully fill the ranks of superintendents of the works as we advantageously might. We can most of us learn something here from the Americans. A clerk of works, capable, worthy man though he be, whether formerly a joiner or of any other trade, is considered generally to be doing his whole duty, which he probably is, by watching material as it arrives to see if equal to the contract requirements, by keeping data as to weather, number of men employed, &c. This, in any work above a small one, needs augmenting. By all means retain the clerk of works for these necessary duties, adding to them the keeping of progress plans, but in any more important work, another, and a more highly trained assistant, or half a dozen such, may be added. It is impossible to carry out a large work with expedition without the aid of plenty of superintendence. If there is much steel employed, a qualified engineer is needed at the steelworks to test the materials and to personally see that the proper rolling is done, and that the beams, stanchions, and work generally as first needed are being put together well in time for delivery before they are actually needed for placing in position. Capable men are needed on the building itself to supervise sections of the work, and personally see that the rate of progress is maintained; that whatever materials are needed in succession are on the spot. There must be a system of organisation, and each individual supervisor must know his position in it, and undertake that his individual section lacks nothing by want of foresight. These superintendents, under the control of the architect, must look forward in their work, and convince themselves all is ordered well ahead and to be in time. Organisation by a capable, practical head is needed—and the architect is the man appointed to be that head and director. On my own buildings I have "progress" plans, with the dates upon which certain parts of the work are expected to be completed, it being the duty of the superintendent of any one part to see that such instructions are carried out. He has a defined work to see to. In a building we have now on hand in the North, covering some $5\frac{1}{2}$ acres of land, this is done, and every part of the work mapped out. It is organisation. It saves time, and is methodical. This is what an American would also do. You probably do it also, but it is not universal. In one building we were doing there was a large amount of timber necessary, which we bought in America; and we had an inspector in our own pay at New Orleans to inspect the timber before being put on board, in order to insure proper material and despatch. An American would act similarly. There is in all new buildings a certain speed of erection which forms the most lucrative rate to the contractor. If, on the one hand, he gets too slow, the cost of erection is enhanced, and the same remark applies if he is excessive in speed. Consequently, if an architect (and the proprietor through him) asks for tenders for the execution of certain works, with the intention of placing the contract with the firm submitting the lowest prices, he can, in equity, only expect that rate of speed at which the contractor makes most profit, for that is all he tendered to do, and is all the proprietor is paying for. The great majority of contracts are let in this country on this understanding, for the date of completion which is named on the contract is calculated on this footing. Neither an American nor any other contractor tendering on this basis would spend his money on accelerated speed if he reaped no benefit thereby. This part of the matter resolves itself into a small compass. If a proprietor wishes a very quickly erected building he must pay the necessitated additional outlay enabling the contractor to effect it at a reasonable profit. Herein lies the germ of the whole matter, and herein comes the American greater keenness at once. We have not fully risen to the fact in connection with the great bulk of our contracts that if a proprietor saves £1,000 in interest on his land value by quickened construction, it is a very good business to spend £750 in order to obtain it. It is, of course, no new thing to us; but we have not as fully realised it as we should. An American proprietor not only does appreciate this, but he acts on it, and will spend more than the £1,000 actually saved in interest, because he makes money by having his works and premises as a going profit-making concern all the sooner. There are many in this country who see all this and act on it; but it is not general. Given the same rate of payment and the same conditions, an English contractor will work as quickly, as well,

as thoroughly, and as satisfactorily as an American, and better in some manners and ways, which we, in this island, prefer. I will presently give you an instance of this. In making a contract my sons and myself give a penalty for non-completion, with an exactly similar bonus for earlier termination. We find the result just as anticipated, and that we often have to certify for a substantial bonus. It gives us much pleasure when this occurs, for it is an extra payment due for diligent service, good business organisation, and a gain to both proprietors and contractor. If, however, a very speedy work is desired, bonuses are given the sub-contractors for the acceleration. If some imaginary buildings were worth £100,000 to erect in eighteen months, and the builder were offered £10,000, or £15,000 if completed in fifteen months, there would be a strong inducement to pay extra wages for a choice of good workmen and plenty of them, to find bonuses of 1s. 6d. per thousand for bricks for earlier delivery, to provide many a half-crown or five shillings to men to complete a certain thing by a given time, to pay £2,000 for early delivery of steel or stone, to put down the speediest machine, to berth additional superintendents to hustle things up. An American would take greater risks in addition, for they do not put scaffolding like you do in London. Herein, I reiterate, lies the germ of the whole matter: the readiness of the proprietor to pay for the extra speed or advantage.

WHAT ARE WE DOING IN ENGLAND?

Having thus dealt with the factors making for the American methods, let us now consider whether in England we have been doing anything very similar. I can only speak of building in the North, where we are accustomed to work harder, one hears, than the generality in the South. And in entering upon this phase of our subject I can only speak with authority upon those buildings coming under the jurisdiction of my own firm. There has been much talk about the number of bricks that can be laid per day. At the Westinghouse Works, Manchester, where I was associated as architect with Mr. Rodd, one of the first engineers of America, it has been said that on a part of the work 1,600 bricks were laid per man per day. It is quite correct. We have had this number laid in a two-brick wall at a very different kind of a building to a big works—Parr's Bank, Manchester to wit—with ordinary bond set by trowel in mortar made with Wormsworth Cliff lime. This was without paying extra wages either. But 1,600 bricks was not the average, and I know of no building where such has been the average. But you may learn something from the Westinghouse Works, although the conditions were not those of an ordinary building let under one contract to one builder. No contractor was ever asked to undertake the whole contract. All heavy work was let per ton, per cube foot, per square yard. The excavating was let to one firm, the steel to another, the slating to another, and so on—all English firms. On one side of the site were brick kilns, and whilst the excavations were in progress some 4,000,000 bricks were made and stored, the site was levelled, about eight miles of railway track laid down, connecting all parts of the works together, and proceeding from a main track from the Ship Canal Docks and the principal railway systems, timber was stored adjoining the rails, the large machine-shop foundations were in, the steel work well commenced—in fact, there was a quarter of a million pounds worth of work done or material delivered on the site before an American contractor came to employ bricklayers, carpenters, &c. He did not come as a contractor with a contract price for doing certain work, but as an official of the company. Therefore there is no comparison of this work with that of a general contract. But he got the work pushed on rapidly, and by saving time, saved the company interest on their money, and being empowered by an enlightened board to employ as many men as could be utilised, he accomplished the speedy work. And please note that the architects had every drawing ready. There was no delay of five minutes for instructions. There was nothing to wait for, and extra wages were given to men, enabling the best to be picked out and retained on the job. If you want brickwork executed at a great rate, have heaps of material ready, and put on every man you can. Pick out and keep the best men, discharge the others, and to entice the best men to your work and to spin out all they know, make it worth their while to stop by paying 10 per cent. more wages, give bonuses for work executed against time, and

have plenty of superintendents and foremen. It may not be the best finished or the most durable, but we are talking of speed and how to obtain it. A great feature in the speed of bricklaying is the kind of foreman employed. If he be a man of ability, understanding his work, and with sufficient will power to have the work carried out as it should be, and retaining only the competent workers, the work progresses properly. There can be no criterion of how many bricks should be laid in, say, backing up stonework, erecting buildings partly stone and partly brick; but in an ordinary building, faced with stocks, with stone dressings, general internal walls, with the usual doorways, arches, fireplaces, flues, beam filling, and such like, if a bricklayer averages throughout 700 English bricks of common brickwork per day of 10 hours, he is doing a fair day's work for 8s. 4d. An American friend of mine, Professor John Gray, of the North-Western University, Illinois, to whom I have been of service in giving data regarding British labour for his returns to the American Government, wrote to me in the spring of this year about bricklayers' wages in America. The *Chicago Tribune* of February 14, 1903, contained reference to this subject. It says:—"Some 4,000 members of the Bricklayers' and Stonemasons' Union have been granted a wage increase. The bricklayers have been getting 4dol. 40 cents a day for eight hours' work, and they ask for 4dol. 80 cents. This was given them as a set scale, and to be in force for three years. The men also demanded a half-holiday on Saturdays for six months in the year, and it was granted." This increase, without a strike, was equivalent to a rise of 10s. per week. Professor Gray added the following very expressive remark:—"It seems to me that, notwithstanding the numerous strikes in this country, our employers are more likely to grant demands, especially for increase of wages, than the English employer is, and to try to speed up to the new scale. I believe it cost less per 1,000 to get bricks laid new in Chicago than when men were paid 2dol. 40 cents for 10 hours' work, instead of the before mentioned 4dol. 80 cents for eight hours' work." This price is half a crown an hour. This would be an incentive to labour-saving machinery one would think. America is not without serious labour difficulties and strikes. In connection with this matter I have been at some trouble to obtain data of English bricklaying under English superintendence. I will cite a few, all of which have been vouched for to me. Great Northern Railway extension, Manchester, foundations 3ft. thick, hydraulic lime mortar, English bond, average 1,760 bricks per man in nine hours. The same building: stanchion foundations, blue bricks in cement, 1,056 bricks per man in nine hours. The same building: 3ft. wall, both faces finished with blue picked bricks in cement, 704 bricks per man in nine hours. The same building: wall 18in. thick, common brick in hydraulic lime mortar, English bond, wall faced one side in picked bricks, 846 bricks per man in nine hours. On a job in Bolton, 18in. wall, faced with selected bricks pointed up, 882 bricks per man in nine hours. At the same job, in an abutment 8ft. thick, faced one side with white glazed bricks in putty mortar, 909 bricks per man in nine hours. All these bricks were laid by men on ordinary wages of tenpence per hour under trade union rules, and without bonuses, &c. Let me give you another fair instance of this class of work. We, my sons and myself, have recently erected a refrigerating store near the Market, Manchester. It has basement and sub-basement and nine other floors. It is faced on two sides with stock bricks, panelled with arches, and has terracotta mouldings, bands, cornices, &c. Taking basement walls, face-work, setting round terracotta, windows, openings, lift recesses, &c., the brickwork from first to last averaged 750 bricks per man per day of ten hours, on ordinary wages. The most speedy erection of an ordinarily finished building ever managed in Manchester was that of Peak's Warehouse, Portland-street, in that city. It was done by Robert Neill and Sons, builders, under us as architects. It will be of interest to you to know the methods adopted, especially as it was entirely initiated, organised, supervised, and executed locally. It is only the laudations poured upon foreign work that have caused me to mention this. The building is a seven-storied warehouse for the home trade. There are three hoists, the usual counting-house, private office, kitchen, fittings,

&c. Every wall and ceiling plastered, and the building generally well fitted up with counters, electric light, &c. It stands on 1,000 square yards of land, and faces into three streets. The old building was gutted by fire on July 24, 1902. One side wall had to be taken down, one façade had the stonework of a floor to be replaced, and the back had to be half-rebuilt. In rebuilding it was decided to adopt more modern planning, which necessitated different lines of columns, increased height, and new work even to the column foundations. The clearance of the debris and insurance matters took until September 7. On that date the contract was signed. At the time of signature complete drawings and details were handed to the contractors, Messrs. Robert Neill and Sons, Manchester. We arranged that the steelwork should be erected by the steel engineering contractor, so that this part should not be dependent upon anyone. We had arranged with a mill to commence rolling for us within twenty-four hours of receiving our instructions, and also with a foundry to work in three shifts of eight hours each to get the cast work out. The whole work was under the immediate supervision and organisation of Mr. Harold Heathcote, one of my partners, with a clerk of works to keep the progress notes, &c. The result of organising and looking ahead, spending £500 for additional cost in pushed labour, and having a first-rate building firm to deal with, resulted in the whole warehouse being completed and business resumed on January 24, 1903, or twenty weeks from signing the contract. The cost was about £23,000. From the date of the contract to the time the whole of the iron columns, beams, and floor-joists for seven floors, inclusive of ordering, making, and erecting, were in position, was only seven weeks, showing what can be done if one only sets about it in the right way. It was the result of trained organisation and preparedness.

AMERICAN COMPETITION.

I have mentioned the thought Americans have put into some lines of business to undercut our manufacturers. Let me give one example in connection with our building trade. Perhaps in America the extremes of weather make it more a necessity to very carefully consider the question of heating buildings than with us. But it is of sufficient importance to our comfort and general health that our system and our appliances be as perfect as we could devise. Yet we did not as carefully study the subject as we might have done, until American competition has forced our manufacturers to do so effectually. It is an industry closely connected with buildings, so may be taken as an instance of how we did not master the subject as we might have done, and should probably have continued in complacent satisfaction had not American competition forced our heating-apparatus makers to do so for their own protection, and with the usual result, for some of our manufacturers are to-day producing cast sectional boilers and radiators equal to either American or French in price, finish, and efficiency, although not yet in as many varieties or of the largest capacity. If they will do this, they will at least again command the market of their own country, and they may be trusted to then push forward the export of their wares. To obtain the best article the American manufacturers concentrated their fullest thought, energy, and scientific knowledge upon the character of the metals best adapted to meet the various requirements of softness, non-porosity, smooth clean finish, and uniformity of thickness in casting. This was specially directed upon what are known as sectional boilers where enormous heating surface is required, where the pressure is high. With them method and standardising are enforced in fitting and erecting, and in having the template of each member numbered and indexed before leaving the works, so that in the event of any of the component parts requiring renewing they can easily be duplicated. Large quantities of radiators have been shipped to Europe within recent years. One firm at all events was quite prepared to have their work done in France, because it was found that the French workmen bestowed greater care and interest on the moulding and casting of radiators, producing a most reliable and beautifully finished article. These improvements, as I have said, were so materially affecting the English trade that the necessary incentive was created—the incentive of self-interest, and we are again holding our own. We shall do more than this if our manufacturers will give up their conservatism

altogether and increase the varieties, and also the capacity, of the heating boilers, and not need more foreign competition to jog them up again. We were slow to adopt the telephone, electric tramcar, the electric light, the motor-car. We sometimes expect to compete successfully with those countries which adapt themselves to the quickly-changing conditions of life. It is our conservatism that is injuring us; and it might be added it is competition that is stirring us up. The young Englishman in this or any other business needs to devote more time to studying the technical details, learning the methods of other countries, and from that knowledge striving for high standard of workmanship and enterprise in combination with originality. May I suggest that the Institute of Builders use their influence towards getting all apprentices to pass through building construction classes in the technical schools? In very large buildings where there is much architectural treatment involved, the architect is generally very fully employed in quietly, earnestly considering and working out the details of his design, and will perform that duty more whole-mindedly if not constantly diverted by personal superintendence as well. It may be worth consideration if there might not be with advantage in, say, great Government contracts, an architect, associated with the designing architect, who will have the entire charge of superintendence. And for each of these architectural positions the best man for English buildings is a trained, energetic, high-minded English gentleman. There are many men answering this description, and as capable as can be found in any land.

LABOUR.

The question of labour is most difficult to answer. Quoting from a work by Mr. J. F. Fraser:—"The raw material from which America produces its workers is the finest procurable in the world. America is not the dumping ground of the world's refuse. The immigrants into America are hardy Europeans discontented with the conditions in the old countries, but who have saved enough to set out and try their abilities in the new. Daring, pluck, and enterprise are necessary to break with family ties, and the men who have shown sufficient courage to do this are the very men likely to prosper wherever they settle." And this emigration is a great matter with us. In America, if a man does not work up to all that is in him he is discharged, for there are plenty coming by the next boat to take his place. With us our numbers of the best men are not thus increased, and the trade unions sometimes discourage the good man to do his best, but encourage him to slow down to the level of the poor one. It is often the best men who emigrate, and their places are to some extent filled with an unrestricted pauper refuse from any country wishing to get rid of them. Is this reciprocity? Do we legislate, as I have said, in this, as in our patent laws, for our own country's benefit, and for the advantage of our own people? We are not as alive as we ought in common sense to be for our own interests. This immigration and emigration are serious items in the labour difficulty. It can only be restrained by our working men knowing they will have as much reward here as elsewhere in return for their best endeavours. Do you offer any rewards to your workmen for improvement of knowledge, for suggesting improvements, for specialised ability, thus giving them increased interest in their business? The American gets a real honest joy out of his working. He likes it. His interest is in it. He is optimistic. He knows there are openings for his progress. He has a magnificent belief in his own abilities, and loves to read those papers which prove what a fine fellow he is, and how he overcomes the sleepy European. Enthusiasm is in the air. There is no do-nothing class supposed to be on a higher plane than business men. He sees the wealthy around him working as hard as he does. His English fellow is taught by his Union that if an American lathe-turner works four lathes it is no reason he should be allowed to work more than two, caring not whether the trade thus leaves his employer or not. There is a greater readiness generally in the States to listen to the suggestions of the workpeople, and many of the labour-saving machines are the outcome of this better understanding, and if you look into it you will find English brains well to the fore in inventions. The greater interest of the workman in his work, his endeavour to rise in the world, the better-schemed education he has received, and the

readiness of the employer to listen to the suggestions of improvements, are all factors stronger in the States than in England. The sentiment in England, that a man who belongs to an idle, leisured class is for that reason to be envied, forms a great drawback to progress and efficiency. This example to those less blessed with the world's goods does not tend to enthusiasm for diligent work. To see the wealthiest working hard in the business gives a solidarity of interests, a feeling of contentment to all engaged therein. An American's ambition for wealth and the power wealth gives is greater than ours. He will work longer hours, and when there is no need for it, in order to add wealth to wealth. Whether, in the one life we have, this is a true and worthy ambition is another story, not falling within the lines of this paper. The American employer considers the health and comfort of his people as conducive to his own interests, and endeavours to meet this end by considering their welfare in the dining-rooms and conveniences of the workshop. In many works each man has a locker for his clothes, and has ample arrangements for keeping himself respectable in cleanliness and appearance. It must be admitted there has been no lack of Government interference on behalf of the English workman. Innumerable factory acts, special rules, compensation bills, Board of Trade regulations are in force here that have no existence elsewhere. I believe we shall adopt many American business methods here, altering many of our conditions, and bringing about a more mutual appreciation of the difficulties between employer and employed. This is very necessary to modify the actions of trade unions in those directions for curtailing the output of material and hampering a free working man in doing the utmost he can with his labour, which is his capital. It is the old story in England. The first brickmaking machines were invented in England, but the men working them were murdered. The first building in Manchester where men dared carry bricks without the ordinary hod was the Town-hall, less than 30 years ago. Even then the contractors had to obtain the protection of the police. The whole fallacy of the union's policy of allowing and encouraging a man to do less than a fair day's work in order that some other man may get a job depends, it would seem, upon the false assumption that the amount of work to be done is a constant quantity. There is no limit to the work to be done if we can do it quickly and economically, for there is no limit to human wants. I am indebted to Mr. Mortens, who says:—"Whilst unregulated and unorganised labour must be deprecated, the labour organisations must not block economic progress: the newest machines replacing costly labour must be adopted and be worked as cheaply and efficiently as possible, and the output increased wherever desired. To restrict the better educated and skilled workmen from doing the best and the most they can is an economic fallacy which, if persisted in, will utterly ruin the trade of England. With the adoption of machinery, wages have risen all over England; with the adoption of more modern labour-saving machinery American wages have risen still more. But the fault does not lie with the workers alone. Employers in England have yet to learn the economy and efficiency of high wages, and to acquire some of the intensity of application of their American competitors. It would be very advisable for contractors to spend some time in the States closely and earnestly studying the methods of labour, combination, &c., mentioned. Americans are very hospitable, and will give you a hearty welcome. There is no hampering an American workman in his business. If he can set bricks he is taken on as a bricklayer, and the other workmen do not strike the job because he has not been a bound apprentice for four years. Here it is once a labourer always a labourer; but, there, you are a bricklayer if you can lay bricks. There is also a spice of adventure about the American working man: he will cease to be a watchmaker and take to farming; give up newspaper reporting to start a constructive engineering company, a patent roofing or a patent flooring company; a builder's pay clerk will start, in conjunction with a student, for "electrical equipment in all its departments and permanent-way constructors." It is risky to himself and all who employ him, and shows nothing from which we can derive any benefit. The drink statistics show that the expenditure per unit here is twice as much as in America. If

our workmen would spend only one-half what they do in this line, their wages would increase by their working on St. Monday, now an off-day, and their savings result in scores of millions going into reproductive trade. We should not hear much then about the alteration of Fiscal Policies, for we should be fully employed in one great boom of trade. One way to lessen the difficulty with labour is to pay the best man the best wage you can afford him so long as he gives you his best; make him to realise his best friend is his employer, and that it is his personal advantage to forward the employer's interests. In that manner you will retain the men you really need, and give the natural incentive to the workman's progress and advancement. It is desirable to guard myself from the supposition that I think the struggle to accumulate money should be engrossing, and that it should be a main object of life. I am aware of the grave danger of allowing the consideration of industrial problems to obscure those of a social character. The productive activity of the people depends on their physical, moral, and intellectual qualities, and unless we improve these the industrial problem will hardly be solved. But I do maintain that whilst in business you should do it to the best of your ability, and, if you can learn from your competitors any element of success and method, it is a part of your duty to obtain it, and act upon it with wisdom and with energy. And further, business men should develop the power of initiation, and improvement even upon those desirable elements that are to be gathered from others. We have not yet attained to full perfection in anything, and the future is in the hands of the man with brains to think, self-reliance to carry out, and energy to complete. Many there are amongst us doing this now, making earnest persevering efforts, but the wish to do it is far from universal: far from being the ambition that it should be, and indeed must be if we are to retain all along the line our position in the business world.

CHIPS.

The new town-hall at Chippenham, built at a cost of £35,000, on the site of the Winter Gardens, will be opened to-morrow (Saturday) by the Right Hon. Sir Michael Hicks-Beach, M.P. The architect is Mr. F. W. Waller, F.R.I.B.A., of Gloucester, and the contractors are Messrs. Collins and Godfrey, of Cheltenham and Tewkesbury.

Precentor Donaldson delivered last week at Truro a lecture on the new cathedral in that city, in which he pointed out that although many people complained that it was not faced with Cornish granite, he did not agree with them. Granite did not lend itself to rich ornamentation, would have taken much longer to build, and would have been exceedingly costly. The erection of the cathedral had not only been for the glory of God, but undoubtedly it had benefited a large number of workmen for a considerable number of years. Two-thirds at least of the cost of Truro Cathedral was paid for labour to those employed on the works, and a great deal of the money had gone into the pockets of Cornishmen.

The Dunfermline District Committee of the Fife County Council, at a meeting on Tuesday, approved of a provisional order for providing a water supply for the district at a cost of £104,000. The site of the new Naval base is included within the district, and it was stated that the Admiralty had practically come to an agreement to pay one-third of the total cost of the new waterworks conditionally upon receiving one-third of the total quantity of water available.

The following century-old paragraph has an up-to-date ring about it. "The improvements west of Temple-Bar to open the entrance into the City proceed much slower than could be wished, both for the sake of the neighbours and the public at large. When finished they will render this avenue a great ornament to the Metropolis." It appeared in the *Times* of Friday, December 2, 1803.

On Saturday the shaft of the new electricity works on the western shore at Southampton was completed. The shaft is 200ft. high, and is the highest in Southampton, with a diameter in the flue area of 14ft., and at the top of 11ft. The shaft was erected by the Alphonso Custodis Chimney Construction Co., and was carried out under the supervision of the borough engineer, Mr. J. A. Crowther.

An inquiry was held on Friday at Burnham (Somerset) town-hall, by Mr. E. A. Sandford Fawcett, on behalf of the Local Government Board, of whom the urban district council seeks powers to borrow £3,450 for the purchase of the Manor House property for purposes of public walks and pleasure grounds. There was no opposition.

OBITUARY.

ONE of the most eminent and successful civil engineers has just passed away at the ripe age of eighty-five in the person of SIR FREDERICK JOSEPH BRAMWELL, Bart., F.R.S., who succumbed on Monday to an attack of hæmorrhage on the brain. The third son of Mr. George Bramwell, banker, of Finch-lane, and younger brother of the late Lord Bramwell, Frederick Bramwell was apprenticed in 1834, at the age of 16, to John Hague, an engineer of the old school, and remained with him as chief draughtsman for some years after his apprenticeship had expired. After some experience in various offices Bramwell commenced practice for himself, and speedily became known as an authority on waterworks and mechanical engineering, and as a lucid witness and painstaking arbitrator. In 1874 he became President of the Institution of Mechanical Engineers, and delivered a stimulating address upon the duties and responsibilities of its members, with a suggestive inquiry as to the possibility of the exhaustion of our British coal supplies. Eleven years later, in 1885, he was elected as President of the Institute of Civil Engineers, a body formed in the year of his birth, 1818. In his presidential address he dealt with the chief factors of past progress, as exemplified in the Inventions Exhibition then opened, and of whose executive council he was chairman. Sir Frederick also strongly urged the desirability of the treatment of heavy steel forgings by hydraulic pressure in place of steam-hammers, and has lived to see this method universally adopted. His presidential address three years later to the British Association at their Bath meeting in 1888 was noteworthy for the brilliant humour and the high literary ability with which the theme of next-to-nothing was treated. He was knighted in 1881, and received, eight years later, a baronetcy, which now becomes extinct. He is survived by his two daughters, now respectively Lady Horsley and Lady Bliss.

THE death is announced, in his seventy-ninth year, of Mr. THOMAS JOHN WILLSON, formerly in practice as an architect and surveyor, the elder son of Edward James Willson, the distinguished antiquarian. Born at Lincoln, the late Mr. Willson was educated at Oscott College, and begun work in his father's office in Lincoln Castle. He planned, says Mr. S. J. Nicholl, in the *R.I.B.A. Journal*, a work on the choir stalls of Lincoln Minster, making many careful sketches and drawings. He, however, was not encouraged to proceed to publication. He pursued his studies on the Continent. His drawings of the metal screen in the Church of Santa Croce, Florence, and of several objects from the treasury of St. Mark's, Venice, were published by Sir M. Digby Wyatt in his "Specimens of Ornamental Metal Work." In 1846 he accompanied Mr. F. C. Penrose to Athens, to assist him in the researches then made for the monumental work on "The Principles of Athenian Architecture." Mr. Penrose, in his preface, speaks of "the beautiful drawings" from which the plates were engraved, as prepared "by my friend and companion, Mr. T. J. Willson," who also "rendered valuable assistance in many other respects." Other illustrations are scattered in various publications: the plates of the pulpit in the Refectory of Topholme Priory, Lincolnshire, in Collings' "Details of Gothic Architecture," were by him, although not signed. The general practice in his father's office made him a specialist in agricultural buildings: the plate illustrative of this subject in the Dictionary of the Architectural Publication Society was contributed by him. At Burnley, he acted for some time as surveyor to the estate of Mr. Charles Townley. Later on he also erected farm buildings at Acton-Burnell and elsewhere. "In 1854 circumstances led him to work with me," Mr. Nicholl adds, "in the enlargement and renovation of the Catholic Chapel at Lincoln (an interior view of this edifice was given in the *BUILDING NEWS* of June, 1861), and on his return to London in 1859 we commenced to work together, and continued to do so till 1869. During this period the public buildings we erected included the chapel and lodge of St. Patrick's Cemetery, Low Leyton, consecrated in 1861; the churches of St. Charles Borromeo, Ogle-street, London; of the Sacred Heart, Accrington; St. Mary, Turnham Green; St. Catherine, West Drayton, and at Bilbao, in Spain; schools of St. James, Spanish-place, Wapping, Little Crosby, and at North Hyde, Middlesex; and additions to the Convents at

Atherstone and Chelsea. The last work he undertook was, in 1896, the girls' school attached to the Dominican Priory, Haverstock Hill; in the preparation of the drawings for this work, I, at his request, was again joined with him. To this list must be added two memorials erected at Portsmouth in 1862, from our own joint designs—that to Sir Charles Napier and of the Cruise of the *Chesapeake*. Mr. T. J. Willson was an Associate of the R.I.B.A. from 1854 to 1900, when he resigned; but of late he gave up much time to the office of honorary secretary to the 'Aged Poor Society and the Guild of St. Gregory and Luke,' an ecclesiastical society, and, above all, to the collation of his father's 'Lincoln collection.' To this he added many of his own careful drawings, hoping that some public body would have acquired and kept intact the entire collection; in this he was disappointed."

MR. EDWARD JAMES MARTIN, M.Inst.C.E., F.R.I.B.A., late Secretary to the Government of Bengal in the Public Works Department, died at Brighton on Tuesday in last week. Appointed to the Indian Civil Service in 1859, Mr. Martin served in the Punjab in the Buildings and Roads Branch as assistant and executive engineer till 1869-70, when he was transferred to the North-Western Provinces, and posted to the Rajputana State Railway. He afterwards officiated as engineer-in-chief of the Tirhoot State Railway and of the Rangoon and Irrawaddy Valley State Railway, and also as ex-officio manager of the latter line, being transferred to the railway branch in Bengal in November, 1878, and appointed engineer-in-chief of the Central Bengal System of State Railways. In January, 1880, he was promoted to be superintending engineer of the third class. The following year he was employed on special duty under the chief engineer in Bengal as Government architect, was promoted to the second class in 1882, and deputed to Indore on special duty in 1884. Mr. Martin reached the rank of superintending engineer of the first class in December, 1885, was officiating chief engineer and secretary to the Government of Bengal in the Public Works Department from June, 1888, till May, 1889, when he was appointed second chief engineer, and from January, 1890, till his retirement in 1891 was chief engineer and joint secretary to the Government of Bengal. Mr. Martin joined the Royal Institute of British Architects in 1874 as an Associate, and became a Fellow nine years later. He had been a Member of the Institution of Civil Engineers since May, 1875.

WE regret to learn that Mr. LOCKERBIE, the managing director of the firm of Lockerbie and Wilkinson, Ltd., of Birmingham and London, died this week. No details are as yet to hand, the news only reaching Birmingham by cable on Wednesday from Johannesburg, whither the deceased had gone on a business trip.

At the meeting of the managers of the Metropolitan Asylum District, held on Saturday, a letter was read from the Local Government Board promising to issue an order authorising the expenditure and borrowing of a sum not exceeding £15,000 in respect of the proposed alterations and additions at the Fountain Hospital, the loan to be repaid in five years.

The Lord Mayor will unveil on Tuesday the bust of Chaucer by Mr. George J. Frampton, R.A., which Alderman Sir Reginald Hanson has presented to the Corporation of London for their Art Gallery at the City Guildhall.

Monday was the final day at the Houses of Lords and Commons for receiving plans and other documents in connection with private legislation for the ensuing Session of 1904. The total number of deposits was 272, as compared with 294 at the corresponding period of last year, the details as regards last night being: Railways 26, tramways 26, miscellaneous 62, and provisional orders (including electric lighting) 158. The figures of last year were: Railways 46, tramways 35, miscellaneous 60, and provisional orders (including electric lighting) 150.

Mr. E. C. Sandford Fawcett, M.Inst.C.E., held a Local Government Board inquiry at the Hall Evercreech, Somerset, on Thursday in last week, into the application of the Shepton Mallet Rural District Council for sanction to borrow £700 for the purpose of a water supply to the hamlet of Chesterblade.

A special meeting of the Beccles Town Council was held last week, when a committee of the whole council presented a report recommending, from among 68 candidates, Mr. T. Owen Cudbird to the office of borough surveyor in place of Mr. T. W. Woodroffe, resigned.

Building Intelligence.

BRETENHAM, NORFOLK.—The final touches to the restoration of this church have just been made at the charge of Mr. J. Musker, of Shadwell Court, Thetford, patron and lord of the manor. All the windows have been filled with stained glass. A carved oak reredos, with painted panels of scriptural subjects, has been fixed over the altar. A new organ has been placed in the north transept. Oak panelling, sedilia, credence, and choir stalls of very elaborate design have been executed for the chancel. A carved oak rood screen spans the chancel arch. The chapels of the north and south transepts are divided from the nave by a wrought-iron grill, and a similar screen divides the tower from the nave. All the walls of the church have been painted and decorated with diaper work. From the roof hang wrought-iron electroliers of elaborate design. The floors are laid with marble slabs, rough, white, and dove-colour. The roof and seats are stained and varnished, a seating of Wilton carpet covering all the pews. A carved oak pulpit and brass eagle lectern were also supplied. The whole of the work was undertaken and executed by Percy Bacon and Brothers, of 11, Newman-street, London, W., at a cost of £2,350.

HOLLINGBOURNE.—On Tuesday the Archbishop of Canterbury held a Confirmation service in All Saints' Parish Church, Hollingbourne, and dedicated the new vestry, organ-chamber, and reredos. The vestry (built by Messrs. G. Ansett and Son, at a cost of £400) is to the memory of the late R. G. De Visse Thomas. It is built of Kentish rag, from designs by Mr. W. D. Caroe, F.S.A., architect to the Ecclesiastical Commissioners. The organ, by Messrs. Norman and Beard, has been removed from its old position on a gallery at the west end, and has been re-erected and enlarged in an organ-chamber above the vestry, the chancel wall being pierced to show the fine front of the organ. This work has been carried out by Mr. W. Walmsley, at a cost of £100. The reredos, executed by Mr. Nathaniel Hitch, of London, from designs also by Mr. Caroe, is to the memory of the late Dr. E. M. Goulbarn, Dean of Norwich. The reredos itself stands on a carved retable of old dark oak, and is of open carved light oak, surmounted by an open-worked canopy of columnar pillars; the background is of purple. The centre contains a representation of the Crucifixion in relief. The panel on the right represents the Virgin Mother, and that on the left St. John.

STOKE DAMEREL, PLYMOUTH.—The Parish Church of Stoke Damerel, one of the oldest ecclesiastical buildings in South Devonshire, has for long been in a state of decrepitude which rendered the erection of a new building to take its place absolutely necessary. On the feast of St. Andrew, the patron saint of the parish—a portion of the new church, comprising the morning chapel and crypt, was dedicated by the Bishop of Exeter. The new building, which it is proposed to erect at a cost of about £20,000, exclusive of the cost of the tower, will, when completed, accommodate 1,400 people. A site has been secured adjoining the rectory, and there have now been built a morning chapel, which will seat about 150 people, and a crypt containing a sub-chapel, sacristy, a clergy and choir vestry, and accommodation for a Sunday-school. The style adopted is Gothic, and the material used for the exterior is a blue polyphant stone. The interior is lined with Bath stone, which contrasts effectively with an open-ribbed barrel roof. The architect is Mr. W. D. Caroe, M.A., of London, and the work is being carried out by Messrs. William Dart and Son, of Crediton, under the supervision of Mr. Bolwell as clerk of works.

At the London Guildhall, on Friday, Walter Theodore Seldon, surveyor, of 24, Canning-road, Croydon, was charged with embezzling cheques for £23, £18, and £21 respectively from his employers, the Corporation of London. Sir H. H. Crawford, City Solicitor, who prosecuted, said defendant hitherto held an irreproachable character and a responsible position, and it was to be hoped he would be able to give a satisfactory explanation. A remand was granted, bail being refused.

Mr. J. F. Delaney, assistant engineer to Dublin Corporation, was unanimously elected on Friday to the position of city engineer for Cork, in succession to Mr. Henry A. Cutler, who has been appointed borough surveyor of Belfast.

Engineering Notes.

LONDON COUNTY COUNCIL TRAMWAYS.—In connection with the general electrification of the tramway system of London, the London County Council adopted, on Tuesday, the proposals of the Highways Committee for dealing with the northern lines which have been leased to the North Metropolitan Company. It has been decided that certain sections of the lines which could be worked with through services of electrical cars shall be first reconstructed, and to these it is intended to apply the underground conduit system of electrical traction. The lines in question are—(1) Theobalds-road terminus, via Clerkenwell-road, Old-street, Great Eastern-street, Commercial-road, and Leman-street to near the London Docks; (2) Norton Folgate terminus, via Shoreditch, Kingsland-road, High-street, Stoke Newington-road to Stamford Hill; (3) and Aldgate terminus, via Commercial-road, Commercial-road East, and East India Dock-road to Poplar; (4) Moorgate-street terminus, via Finsbury-pavement and City-road to junction with Old-street; (5) Holborn terminus, via Gray's Inn-road to junction with Theobalds-road; and (6) along Old-street between Great Eastern-street and Shoreditch. The length of these tramways is about 22½ miles of single line, and it will be practicable for the whole of them to be worked from the electricity generating station which is being established at Greenwich.

CHIPS.

A faculty is to be applied for for restoring the church of King Charles the Martyr at Tunbridge Wells, at an estimated cost of £500.

The Light Railway Commissioners have given their sanction to a scheme for constructing an overhead traveller bridge and electric tramway to connect Portsmouth with Hayling Island. The total cost of the scheme will be about £63,000.

The erection of the first section of Christ Church, Whaley Bridge, which will be a chapel-of-ease to Chapel-en-le-Frith Parish Church, is progressing, and it has just been decided to add a spire to the present structure. It is expected to be complete by Easter next year.

The King has accepted from Mr. J. Brickwood an offer to bear the outlay involved in building a church at an estimated cost of £20,000 for the Midhurst Sanatorium for Consumptives.

A baptistry, with memorial stained-glass window has just been erected at the west end of St. Mark's Church, Tunbridge Wells. It is the gift of an anonymous parishioner, and has cost over £300. During the present year some members of the congregation have built a choir vestry at the cost of £700. The stone for this building and for the baptistry was given by the patron, Lord Abergavenny, whose father founded the church. The son of the original architect drew the plans. The son of the builder carried out the work, and the son of the nobleman who, forty years ago, had decorated the reredos has now restored his father's work.

The London County Council again give notice of their intention to apply to Parliament in the session of 1904 for leave to bring in a Bill for the purpose of dealing with the Thames steamboat service.

At a special meeting of Grangemouth Town Council on Friday, it was agreed to borrow the sum of £30,000 for the New Bannock Burn water scheme in terms of the provisions of the Burgh Police (Scotland) Act, 1892.

A Local Government Board inquiry was held on Friday in the Gorton Town Hall into the District Council's application for sanction to borrow £8,925 for works of street improvement, and £2,261 for a park at Sunny Brow.

Mr. George Goulding, J.P., of Romsey, head of the firm of Goulding and Sons, builders and contractors, for the past twelve years, and a member of the town council for that borough, died last week, aged 51 years. The business was established by the deceased's late father many years since.

Mrs. Eleanor Freeman, widow of the late Dr. E. A. Freeman, Regius Professor of History at Oxford, and the well-known writer on ecclesiastical and antiquarian topics, died on the 26th ult. at East Liberty, Wells City, the residence of her son-in-law, Canon Scott Holmes. Mrs. Freeman was in her 87th year. The daughter of the Rev. R. Gutch, to whom as a private pupil the late historian went in 1840, she became engaged to Mr. Freeman while he was still an undergraduate at Trinity College, Oxford, and was married to him in 1847, two years after Mr. Freeman had obtained his degree.

—BUSINESS PREMISES, NOTTINGHAM.—SALE ROOM AND OTHER SKETCHES.—WEEKLEY HOSPITAL, NORTHAMPTONSHIRE.

Our Illustrations.

NEW MODEL LODGING HOUSE, NEWCASTLE-ON-TYNE.

THIS building provides accommodation for 240 loafers. On the principal floor are the dining-room, recreation-room, and smoke-room, and off the main corridor are the lockers. The dining-room is served from the kitchen on the same floor, and a lodgers' scullery is provided where the men may prepare their own food and cook it at the hot-plate range in the dining-room. A shop is also provided for the sale of groceries, &c. The rest of the administrative part of the building is on the basement, comprising linen stores, servants' quarters, &c. The conveniences are all at the back of the block, and are top lighted and ventilated. The lodgers' scullery is in the basement. On the four upper floors are the cubicles, each cubicle having a separate window. The architect is Mr. J. C. Maxwell, A.R.I.B.A., of Newcastle-on-Tyne.

HOSPITAL FOR THE CITY OF LEEDS AT SEACROFT.

THE hospital which we illustrate to-day is situated about three miles from the heart of the city, in a beautiful wooded park, at an elevation of over 300ft. above the sea. The buildings are spread over a site of over 40 acres, the actual length from one end of the hospital to the other being a quarter of a mile. The administration buildings are in the centre of the view, the wards to the right (or east) being for scarlet fever, with a convalescent home to the extreme left. South of this is a clubhouse for the staff. To the west of the administration blocks are the pavilions for diphtheria and enteric diseases. In addition, there are isolation pavilions for other types of disease. Attached to the hospital is a quarantine station of many cottages, to which infected families are removed until danger is passed. Exclusive of the cottages, accommodation is provided for 452 patients, with a staff of about 220. The entrance is from the main York road. Grouped near the lodge are, on the west, the mortuary, mortuary chapel (with waiting-room), pathological laboratory, and postmortem room. To the south of this a complete ambulance-station; near by a waiting-room for visitors to patients; and on the other side of the road a discharge block for patients. The chief medical officer's house is further to the east in a private garden. The steward's house is near to the stores yard. These are accessible only from the highway. Sixteen cottages provide for married officers. Opposite the official centre of the hospital is a clock and water tower, 110ft. high, containing an illuminated clock with dials 8ft. diameter, and a large storage of water. The administration block consists of the offices and residences for the chief officials, the nurses' home, the female servants'

home, the hospital kitchen, with dining-rooms for the staff in close proximity, steward's stores, dispensary, &c., a students' block, with complete laboratory, forming another building. The hospital wards are one story in height, all connected by glass-covered ways, with subways for steam, water, electric, and gas mains, &c. The heating is by hot water pumped from a central station. The buildings are lighted by electricity throughout. There is a complete operating theatre, &c., and special operating rooms are provided in the diphtheria pavilions. The general contractors are Messrs. Arnold and Son, of Doncaster. The chief clerk of works is Mr. A. Turner, and the engineering clerk of works is Mr. Rayner. The architect is Mr. Edwin T. Hall, F.R.I.B.A., of Bedford-square, London, W.C.

STUDIES OF OLD WROUGHT IRON WORK.

EVERY piece of door furniture drawn on the accompanying plate has its nationality and century inscribed next it, and all the articles are detailed in a useful and careful manner, set out in a business-like fashion. A prize was awarded to the author, Mr. Thomas Batty, of Leicester, for the two sheets of ironwork submitted in the National Competitions for Historic Ornament. The other sheet we shall hope to illustrate shortly.

HOUSE AT HATCH END.

THIS house, which has been erected at Hatch End for Mr. Percy Machin, is treated externally with white roughcast, red tiles to roofs, and red brick chimneys and plinth roofs and black timbers. The interior contains a great deal in oak, chiefly in the doors, ingle nooks, principal staircase, and beams throughout the house. The ground floor consists of entrance hall and staircase hall, with oak screens and open-timber ceilings; sitting hall, with large ingle and red-bricked arched dog fireplace, timber ceiling and beams; drawing room with two large bays; billiard-room 30ft. by 24ft., with large raised ingle-nook and heavy, timbered ceiling; dining-room with large bay and ingle-nook; study, and very complete servants' offices, storerooms, photography and bicycle rooms. The upper floor is approached by two staircases, the principal staircase being 5ft. broad. There is a long main corridor, opening out into which are ten bedrooms, one having a large ingle-nook. The large spare room has a quaint staircase leading up between solid 9in. by 9in. posts and beams, and an open screen to a dressing room over. The whole house is fitted with Well fire stoves in brick, with brick-on-edge raised curb hearths, and the whole of the door furniture, gas standards on staircase and ingle-seat newels, gas brackets, &c., are all purposely made in hammered metal. The whole has been carried out from the drawings supplied by and under the direct supervision of Mr. Melville S. Ward, F.R.I.B.A., and the contractor was Mr. J. Page, of Northwood.

BUSINESS PREMISES, BRIDLESMITH GATE, NOTTINGHAM.

THE two lower floors of these buildings are devoted to showrooms and shops, with large windows essential to this class of business. The arched doorway to the right leads to the offices above stairs. The elevations are in red brick and stone. Mr. Gilbert S. Doughty, of Nottingham, is the architect.

SALE ROOM AND OTHER SKETCHES.

THE old Wheel-back Chair, from a recent sale south of the Thames, fetched the very small figure of £1 6s., and it is in a first-rate condition. The Gothic Chippendale Chair is one of two made for George III., from designs by Kirby, designer to the King, and consequently it has a personal interest. The carved oak Cabinet in the centre of the sheet is more uncommon, and has small drawers in the plinth part, the upper body being separated from the lower by a moulding above the ordinary level. The Staffordshire Toby-tossers describe themselves, and the group of Old Pewter completes the page.

WEEKLEY HOSPITAL.

(For description, front elevation, and plan, see page 776.)

The official opening of the filters erected at Bomains by Bo'ness Town Council took place on Friday. The filters, which are the Bell patent process, were fitted up at a cost of £3,000, and put the copstone on the Lochcote water scheme, which has cost the ratepayers £30,000.

COMPETITIONS.

ILKLEY FREE LIBRARY.—At a special meeting of the Ilkley Urban District Council held on Friday night, it was decided to adopt a scheme involving a total expenditure of £10,000 (including a grant of £3,000 from Mr. Carnegie) for the erection of the proposed free library, public offices, and assembly-hall. Competitive designs for the buildings are to be asked for, and three premiums offered—1st, £100; 2nd, £50; 3rd, £20.

CHIPS.

Messrs. R. T. Relf and Son, railway contractors, have been intrusted by the G.W.R. directors with the contract for doubling the Cornish line from Saltash to St. Germans.

On Wednesday week Mr. E. A. Sandford Fawcett, M.Inst.C.E., Local Government Board inspector, held an inquiry at the Public Offices, Frome, into the application by the urban district council to borrow £3,500 for purposes of electric lighting, £600 for the purpose of making a new road from Portway to Lock's Hill, and £500 for works of sewerage.

The Metropolitan Water Board have approved an agreement to pay to the local authorities of Tottenham and Enfield the sums of £77,750 and £66,000 respectively for the transfer of their water undertakings to the Board. Certain recommendations as to the management of the water undertakings have been agreed to.

The sales at the Mart last week, as registered at the Estate Exchange, amounted to £60,725, and for the corresponding week of last year to £146,123.

The salary of the gas and water manager of the Goole Urban District Council, Mr. T. E. Franklin, has been increased from £225 to £300 per annum.

The new church of St. Andrew at Marsden Colliery, near South Shields, was opened by the Bishop of Durham on Monday. It replaces an old building, and is of stone, erected from plans prepared by Messrs. J. Potts and Son, architects, Sunderland, Messrs. W. D. Allison and Son, Whitburn, being the contractors. There is sitting accommodation in the nave for 200 persons. The outer walls are of Marsden limestone, with freestone dressings, and the internal fittings and seats are of pitchpine.

A new school, which has been erected by the Roman Catholics of Lochgelly, was formally opened on Monday evening by Archbishop Smith. The school has cost £3,000, and has six large classrooms, providing accommodation for over 300 pupils.

Mr. Meade-King, an inspector of the Local Government Board, has held an inquiry at the Derby Town Hall respecting an application of the corporation to borrow £33,400 for extensions of its electricity generating plant and mains, and the provision of generating plant for supplying power to the new electric tramways; £2,225 for works of sewerage, and £695 for street improvements.

The house of Mr. Labouchere, M.P., in Old Palace-yard, having been purchased by the Government for the purpose of accommodating Royal Commissions, will in future be known as the Royal Commissions House, and will shortly be occupied by the Royal Commissions on Sewage Disposal, Coal Supplies, the Militia and Volunteers, and Trade Disputes and Trade Combinations.

The City Council of Westminster have decided to order an inquiry into the manner in which the paving contracts and street repairs for the current year have been carried out. It was stated that most of the work had been two months behind the scheduled time, and that grave complaints had come from clubs and hotels in respect to the delay.

The London County Council has agreed to advance the Marylebone Council £12,265 for the purpose of erecting a block of artisans' dwellings on the John-street site at £3 15s. per cent. per annum, the loan to be repayable within 60 years. A provisional scheme has been prepared, to be carried out at the joint expense of the County Council and the Borough Council, for clearing the Devonshire-place insanitary area and building thereon four blocks of industrial dwellings.

The Bishop of Rochester inaugurated, on Tuesday, the opening of the Belgrave Hospital for Children, Clapham-road. This hospital was originally founded in Pimlico, in 1867, and has been removed to its present site for the purpose of serving a larger working population. The new buildings have been erected from plans by Mr. H. Percy Adams, F.R.I.B.A. The section completed consists of the centre, east, and part of the south wings, and outpatients' building and mortuary, including three wards with cots, babies' ward, in all about 35 cots, and offices for the staff. The cost has already reached £37,000, a sum which includes the site. In order to complete the equipment a further sum of £15,000 is needed.

WEEKLEY HOSPITAL, NORTHAMPTONSHIRE.—Measured and Drawn by W. S. WILLAN.

WEEKLEY HOSPITAL.

WEEKLEY HOSPITAL was endowed in 1611 by Sir Edward Montagu, son of the Chief Justice, for the benefit of five poor men. It stands near to the entrance gates of Boughton House, one of the seats of the present Duke of Buccleuch, and the old seat of the Montagus. Above the door is the inscription "What thov doest do yt in faythe." It is still used as an almshouse. A sketch of the front of the almshouses, by Mr. M. B. Adams, appeared in the BUILDING NEWS for Feb. 12, 1892.

W. S. WILLAN.

· PROPOSED WELSH SCHOOL OF FORESTRY.

A CONFERENCE of Welsh county council representatives on the question of establishing a school of forestry for Wales and Monmouthshire was held at Haverfordwest last week. The movement, which was inaugurated by Mr. Edward Robinson, of Boncath, had secured the support of the county councils of Pembrokeshire, Glamorgan, Monmouthshire, Carmarthenshire, Cardiganshire, Breconshire, and Merionethshire. Sir Charles Phillips presided over the meeting. Mr. Robinson explained that the object was the planting of waste and at present unproductive

woodlands in Wales. A school could be established with 100 to 200 acres of land to start with, and the option of acquiring a further 500 or 800 acres, and the total capital outlay at the outset ought not to exceed £5,000 to £8,000, which could be contributed by the councils according to their rateable values. He believed the Government would contribute about half the amount required, and he assumed that an annual grant of £100 or less from each of the councils would be sufficient to cover all out-of-pocket expenses, and give a good return on capital. There were about a million acres of waste land in the Principality which could grow timber. Of the owners half might require assistance, and the planting would cost not more than £6 per acre. Spread over 30 years, that would require a yearly grant of £100,000 from the Government, the money to be repaid in that period by half-yearly instalments, and by the end of that time they should have plantations worth from £30,000,000 to £40,000,000. In the whole country there were 21 million acres of waste land, and quite eight millions suitable for planting, which in 50 years would be worth fully £650,000,000 sterling. At present we depended on foreign countries for our timber, whilst at least £8,000,000 per annum might be saved if our waste lands were properly afforested. He moved that it was desirable to establish a school of forestry for the whole of South Wales

and Monmouthshire. Mr. David Jones (Monmouth County Council) seconded. The chairman pointed out that under the Settled Lands Act money might be borrowed at £1 16s. 11d. per annum (principal and interest), spread over 40 years, for the improvement of land, subject to the control of the Board of Agriculture, and the planting of trees was included in the definition. The resolution was unanimously carried, and it was decided to hold a further conference at Swansea.

The Light Railway Commissioners are being applied to this week to sanction a line to Bradwell and Castleton, in the Peak District. The line will commence by a junction with the Midland Railway near Hope Station, and will be just under three miles in length. About four acres of land are to be acquired at Bradwell for a generating station and electric-car sheds.

The tower of the parish church of Wichnor was recently restored at a cost of £550, and dedicated to the memory of the late vicar. The dedication service was held last week.

The Bristol Tramways Company purpose applying for a provisional order to enable them to carry out certain extensions of their system increasing their mileage to forty. It is proposed to take powers to run to Mangotsfield, Hanham Abbots, Filton, Long Ashton, Westbury, and Henbury.

PROFESSIONAL AND TRADE SOCIETIES.

EDINBURGH ARCHITECTURAL ASSOCIATION.—At a meeting of this association held on the 25th ult., a paper was read by Mr. David M. Nesbit, Leicester, on "Warming and Ventilation." Architects everywhere, said the lecturer, insisted inflexibly that the schools they were about to erect, the colleges and universities, the theatres, the places of worship, &c., should now and for the future be placed under the best hygienic conditions, and, more important still, that the hospitals for the sick and injured and all places devoted to the great science of healing should have unfailingly the essentials of pure air and an even, genial temperature. School buildings required special treatment, and he was sure that not less than 1,800 or 2,000c.ft. of air per hour should be given to each child in public schools, so as to insure the maintenance of a healthy atmosphere. Having urged the advantage of the plenum and vacuum systems, Mr. Nesbit referred to the cabinet system, an invention of his own, which he had called the "Copenumette," the novel feature of which was that a recess was built in the wall above the floor line, and the heating surface was fixed within. The whole of the apparatus was out of the reach of the occupants, and yet gave ready access for adjustment of heat and ventilation. It could be readily dealt with for repairs, could be kept scrupulously clean, and, in a word, it might be regarded as strictly hygienic. His desire for a wide adoption of the Cabinet arrangement was founded upon the vital necessity of cleanliness in the apparatus that directly conveyed air to the lungs. Warming and ventilation, he maintained, should go together. These matters as far as regarded churches and chapels had not in the past had the consideration needful; but he noted that those responsible for the health and comfort of their congregations were gradually overcoming the defects. He advocated the plenum system for public buildings, and pointed out that the overhead plenum system, to force the air downwards from above the ceilings, has already been carried out with successful results. The lecturer also spoke of the waste of steam traps, hot wells, &c., and showed how that waste could be prevented and economies obtained.

NORTHERN ARCHITECTURAL ASSOCIATION.—At a meeting of this association, held in Newcastle on Friday night, the Rev. Canon Savage, of South Shields, read a paper entitled "The Distinctively English Type of Church." Taking the subject from an historical point of view, he said he had two things in mind. First of all, he wanted to see what evidence they could get from English architecture as to the sources of religious life in England. Side by side with that he wished to bring out some points which showed the characteristic English national character. At the present time, the fashion was a sort of Little Englander fashion—to decry everything in English architecture. But he held that there had been a very distinctive national character in church buildings, right through—a sturdy common-sense character. That was no conglomerate—not a mixture of Celtic, Norman, French and German, and Italian and Byzantine, which all had differences. Canon Savage began with the Augustine Mission at Canterbury in 597, and the Northumbrian in 635. For forty years, in the Northumbrian Mission, there were nothing but wooden churches. Then they commenced to build in stone, the first churches being at Monkwearmouth and Jarrow. They got an entirely new type of church, with rectangular nave and chancel. The Northumbrian Mission spread all over England, and, with the exceptions of Brixworth and Wing, they had in all the churches over the whole country the rectangular east end. The western towers were probably refuge towers, and served a further purpose of being a lookout. This was characteristic of the period between the early Anglian and the Norman. From the prevalence of the Northumbrian form, they had evidence that it was from the Celtic mission and not from the Italian that this country got its conversion. The lecturer dealt with the influence of the Norman invasion, who put down everywhere their almost brutal form of architecture. There were beauties in Norman architecture, but the architecture generally was brutal, coarse, and heavy. Their idea of church government was strong monastic centres. But it was a curious thing that, within a century, the Norman apsidal churches had to give way to the normal national type of a rectangular east end. Then, from 1175 to 1195, they had the most rapid

development of architecture in all the centuries of the past. Thus they came to the distinctively Early English style, and here they had the strong assertion of the English restraining taste and common sense. At the end of the 12th and the beginning of the 13th century, all over the country, they had in almost every parish indications of church building. There was the uprising of the English as a nation. After that the style tended to become fantastical, in the Decorated period. Canon Savage brought his lecture down to the period from 1345 to 1355. The wars had broken down the power of chivalry, and gave the English a national life, and gave them the idea of a national army and navy. There was a great commercial development, and the Commons became the dominant partner, and the national life struck out in many ways. English was adopted as the national language; and there was the influence, also, of a black death. All this was translated into the church building, and they got developed the purely English type—the Perpendicular, which was the type of the plain, common-sense, average Englishman. So they got a complete preponderance of the Perpendicular everywhere except in Northumberland—partly because of the crushing influence of Durham Abbey and partly because of the fear of the Scotch. The Perpendicular style was the expression of free national life.

THE SOCIETY OF ARCHITECTS: CHANGE OF ADDRESS.—The Society of Architects has removed from St. James's Hall, Piccadilly, W., to its new premises in Staple Inn Buildings (South), Holborn, W.C. The new premises, built from plans by Messrs. Alfred Waterhouse and Sons, and illustrated in our issue of Aug. 14 last, adjoin Old Staple Inn, and are nearly opposite Gray's Inn-road. The second ordinary general meeting for the session 1903-4 will be held in the new premises on Thursday week, the 17th inst., at 8 p.m., when a discussion will take place on "A Bill to Amend the Law Relating to Ancient Lights."

CHIPS.

An order of adjudication has been made in the case of James Ellis, of Charlton, Kent, surveyor.

At a council meeting of the International Society of Sculptors, Painters, and Gravers, held on Dec. 2, Monsieur A. Rodin, the distinguished French sculptor, was elected president, in succession to the late Mr. James McNeill Whistler.

It is intended to remove the Catholic church now adjoining Prudhoe Hall, Northumberland, and to rebuild it at Prudhoe-on-Tyne. The church is a handsome building of stone throughout interior and exterior, complete with sacristies, tower, gallery, baptistery, chapels, and donor's vault, &c. The direction of this work is in the hands of Mr. Charles Walker, architect, Newcastle-on-Tyne.

The memorial to Sir Walter Besant, erected by his "grateful brethren in literature," will be unveiled in the crypt of St. Paul's Cathedral on Friday in next week, the 11th inst., at 3 p.m., by Lord Monkswell.

At a special meeting of the governors of the London Hospital, held on Wednesday, the House Committee reported that the rebuilding of the institution had now reached its last stages. The erection of a nurses' home at a cost of £10,000 had been begun, and Hebrew wards would be opened at an early date.

At a general meeting of the Society of Oil Painters, Piccadilly, held on Wednesday evening, the following were elected members:—Messrs. Charles Sims, H. Van der Weyden, E. Reginald Frampton, A. D. McCormick, Philip E. Stretton, and Miss Dorothea Landau.

A site for the erection of a statue to the late Mr. Quintin Hogg, founder and president of the Polytechnic Institute, Regent-street, has been granted in Oxford-circus.

The Earl of Aberdeen will open to-day (Friday) the extended premises of the Edinburgh Medical Missionary Society in the Cowgate of that city. They have been built from plans by Mr. T. P. Marwick, at a cost of over £5,000.

Lord Roberts has promised to unveil at no distant date the war memorial erected at the Jesuit College of St. Stanislaus, Beaumont, Old Windsor, in memory of the five old boys who lost their lives in the South African war. It is from designs by Mr. Gilbert Scott, who was educated at Beaumont College.

Mr. Robert McCallum, for many years on the engineering staff of the Department of Public Works of Ontario, has been appointed city architect of Toronto.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, Clement's House, Clement's Inn Passage, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED.

Telegraphic Address:—"Timeserver, London."
Telephone No. 1633 Holborn.

NOTICE.

Bound copies of Vol. LXXXIII. are now ready, and should be ordered early (price 12s. each, by post 12s. 10d.), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLVI., XLIX., LI., LXI., LXII., LXIV., LXV., LXVI., LXVII., LXVIII., LXIX., LXXI., LXXII., LXXIII., LXXIV., LXXV., LXXVI., LXXVII., LXXIX., LXXX., LXXXI., and LXXXII. may still be obtained at the same price; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Handsome Cloth Cases for Binding the BUILDING NEWS, price 2s., post free 2s. 4d., can be obtained from any Newsagent, or from the Publisher, Clement's House, Clement's Inn Passage, Strand, London, W.C.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) for any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 60s. 0d. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.). To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of eight words, the first line counting as two, the minimum charge being 6s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Situations and Partnerships.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" and "Partnerships" is ONE SHILLING FOR TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

* Replies to advertisements can be received at the office, Clement's House, Clement's Inn-passage, Strand, W.C., free of charge. If to be forwarded under cover to advertiser an extra charge of Sixpence is made. (See Notice at head of "Situations.")

Rates for Trade Advertisements on front page, and special and other positions, can be obtained on application to the Publisher.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

J. WINTERBOTTOM.—The new War Office was illustrated in our issue of March 31, April 7, 14, and 28, 1899; and a further description appears in our number for Jan. 4, 1901, p. 7.

RECEIVED.—M. A. and Co.—W. P. H.—H. C. P. Co.—Tagliani.—M. and K.—B. D. H.

"BUILDING NEWS" DESIGNING CLUB.

THIRD LIST OF SUBJECTS.

A Clergy House, with a small hall for meetings incorporated in the building, which is to be located in a town slum street, on a site facing south, with a basement and a level frontage, 50ft. wide and 65ft. deep, the adjoining houses being shops below and lodgings above, with facades 45ft. high to top of parapets, their elevations being flush with the frontage line. The new building is to set back, so as to provide an area, with steps down to basement level; but a projecting wing or porch bay should be arranged, within the depth of which the steps to front entry are to be contained, the ground floor being 3ft. 6in. above the street level. The exact width of the area from back to front is left open for the competitors; but economy of space is essential. The area steps to be 3ft. wide. The elevation to be in red salt-glazed brick, with copings and strings of the same material. The casements to be metal, in stout wood-mullioned frames, painted white. Roofs tiled. The accommodation to furnish a hall on the ground floor, 50ft. long by 23ft. wide, having a small platform at one end, with a separate entrance from the house, the main door to the hall being from the clergy house vestibule. A parish priest's consulting-room must be placed on the other side of the same vestibule, and the hall of the house is to be beyond, where a good staircase, 4ft. wide in the going, is to lead up and down. The basement to contain a workshop for lads, 22ft. by 20ft.

deep, and a lavatory and w.c. for their use, isolated from the main building. The kitchen and offices in the basement. On the first floor, two sitting-rooms for the clergy, one being the refectory, fitted with a lift. There must be six small bedrooms for the clergy, one being somewhat larger (say 11ft. by 12ft.) for the vicar. There must be two bath-rooms, a lavatory, and two w.c.'s for the clergy's use. These bedrooms may be partly on the first floor and on the second floor. On the third floor two rooms for the servants with a small private staircase for their use, right up from basement, where their bath-room and closet may be situated, though this position is optional. There is no light available from either side of the site, and no approach from the back; but light can be had from the rear, where there is an open churchyard. The hall is to be 15ft. high. The ground-floor and first-floor rooms 11ft. high, other rooms 9ft. 6in., and in the basement 13ft. high from floors to ceilings. Two elevations, one section, and plan of each floor. Scale 5ft. to the inch for elevations, but the plans may be one-sixteenth of an inch scale if space is limited. A sketch view is desirable. Drawings to be received on Jan. 2, 1904.

DRAWINGS RECEIVED.—Ninety-one designs were received for the Solicitor's House:—"Spero," "Yew Tree," "Last Man In," "Val," "Frouge," "Frena," "An Old Scholar," "Auto-Car," "Vulcan," "Cris-Cross," "Marquis," "Bucolic," "Norseman," "Seasider," "Bill," "Cledadyn," "Tajus," "Kingston," "Imprimatur," "Zigzag," "Jap," "Arabitan," "Lex," "Laverock," "Dingle," "Wee McGregor," "Ionic," "Obelisk," "Friar Tuck," "Shine," "The Magpie," "Six-and-Eightpence," "Leofric," "A Scot," "Cast," "Alpha," "Regent," "Primus," "Vectis," "Gayville," "D'Artagnan," "By Pen," "Detur-Digniori," "Tryfan," "Marcus," "Try," "Puck," "Kangaroo," "Tenderfoot," "Vale-o-Lane," "Sam," "Eurymedon," "Pan," "Mich," "Legal," "Orchid," "Jacobean," "Mr. Dooley," "The New boy," "Leo," "Architect," "Wee McGregor" (Galashields), "Adze," "Tyne" (much too large a sheet; see rules, or you will be excluded), "Saucy," "Cave," "Canen," "Knight," "Novocastria," "Cadric," "Ghost," "Marksmen," "Black Heart," "Jacobean," "Halifax," "Pip," "Jingo," "St. Nicholas," "Liver" (your name and address cannot be read. Learn to write plainly), "Consul," "Loidis," "Plumb-bob," "Lyric," "Inside Right," "Croesus," "Tree Square," "Quatre Vois," "Opportunity," "The Kid," "O. B.," "Omega," and "Old Mercer" (very late).

"O. K." omitted to give his name and address, therefore his drawings cannot be returned.

Correspondence.

BRIGHTON HOSPITAL FOR WOMEN COMPETITION.

To the Editor of the BUILDING NEWS.

SIR,—As a competitor, I wish to call your attention to the extraordinary proceeding in connection with the above competition. Shortly after the designs were sent in an invitation was issued by the committee inviting competitors and the general public to an at-home to inspect the designs; but a few hours before that function the competitors received a notice informing them that they (the competitors) would not be allowed to attend.

The award was eventually made, and we have now received a notice that we shall only be allowed to inspect the selected designs.

Was not this an extraordinary way of treating the competitors? Surely competitors, after spending so much time and money, should have been placed on the same footing as the general public? I really think the committee ought to have given them an opportunity of inspecting the whole of the drawings, so that a full comparison might have been made, thus enabling them to benefit by any salient points that might have struck their notice in any one of the designs.—I am, &c.

COMPETITOR.

ARCHITECT'S SECRET COMMISSIONS.

SIR,—I concur with your correspondent "F.R.I.B.A." in your last issue, that the above subject is the one above all others requiring the urgent attention of the R.I.B.A. It is not enough, in my opinion, that members should sign agreeing to the charter and by-laws, which distinctly prohibits secret payments of any sort, for I know members of the Institute who do not hesitate to accept these degrading commissions in various ways, which does more harm to the profession than can be calculated. As "F.R.I.B.A." says, the architect who stoops to such dishonest practices cannot do justice to his client, nor does he command the respect of either contractor or tradesman from whom he receives his illegitimate commissions.

I had occasion some years ago to commence a correspondence in the *Irish Builder* on this subject, for there I found one or two instances where matters had gone much further than anything I had come across on this side of the water. I think that every architect desirous of upholding

the status of the profession ought to impress it upon all his pupils and assistants what a degrading and lowering practice it is. How I wish it could become one of the subjects of the R.I.B.A. examinations, and how much more do I wish to see every member of the Institute who lowers himself to such an extent be disgraced by expulsion from membership! Is it possible to have a committee of members to collect any information they can, and, after exhaustive inquiries, press for action to be taken under the charter and rules of the Institute? Again, this is an appropriate time to mention another point, Christmas being close at hand, and that is the acceptance of Christmas gifts from contractors and tradesmen. How many of them would be only too glad if all architects would signify their disapproval. It only wants doing once: by making a rule, as I have done, to return same without any offence whatever.

I believe that accepting illegitimate commissions is even a more important subject to be brought before Parliament to be made a criminal act than is the passing of the Architects' Registration Bill.—I am, &c.,

WILLIAM R. GLEAVE, A.R.I.B.A.
18, Low-pavement, Nottingham.

INCREASE YOUR INCOMES?

SIR,—I inclose an advertisement taken from your contemporary the *Builder*, with the reply thereto, hoping by making it public you will save architectural draughtsmen the humiliation of answering it should it appear in your journal.—I am, &c., J. E. R.

ARCHITECT'S Managing Assistant required. Architect's assistants can add materially to their income in a legitimate manner, with little trouble and no pecuniary outlay. Particulars, address Architect, care of—.

[COPY OF REPLY.]

DEAR SIR,—In reply to your inquiry as to my advertisement in the *Builder*, it has probably occurred in your experience, as it has in mine, that an architect of your acquaintance, and possibly your employer, may have at some time (from press of business, or other causes) required the services of a quantity surveyor, other than the one usually employed, in the preparation of quantities, measured accounts, &c. If you know of any such architect now requiring, or likely to require, the services of a surveyor, and you are instrumental in introducing the work, either directly or indirectly, I should be pleased to share with you the bonus I usually receive from a well-known and fully-qualified London quantity surveyor on the introduction of work. When this gentleman's name is given, there will be no question as to abilities, position, &c.

The terms of the quantity surveyor, whose name I shall give you, are most reasonable, and for, say, a £10,000 job, you would get about £20, part of it at once, and the architect whom you introduce would also effect a considerable saving.

Having benefited myself in the manner indicated amongst my more immediate acquaintances, I naturally concluded that the advantages might be extended by making it more generally known (but, still, the number will be strictly limited), consequently my advertisement.

On hearing from you in reply, whether or not you are of opinion that you could introduce business, either now or in the near future, I should be pleased to furnish you with further particulars and copy of memo of proposed agreement between us. In this agreement it may be arranged that the bonus come through you instead of me if preferred. All communications will be treated as strictly private and confidential.—Yours truly,

Intercommunication.

QUESTIONS.

[12028].—**Chalk Gravel.**—Can any reader name a district in the south of London, within 20 miles of St. Paul's, which is undoubtedly either chalk or gravel soil? I mean, where the whole neighbourhood is of one of those formations, so that in selecting a house one can be sure it is on a pervious soil.—R. A. R.

REPLIES.

[12024].—**Rainwater.**—Thanks to "E." for answer. Could not slate tank be fixed outside scullery to catch and filter water to be used for all purposes, so as to do away with necessity for force-pump?—A. B.

A Benevolent Association in connection with the Furnishing and Allied Trades has recently been formed. The inaugural dinner is to be held at the Criterion Restaurant on Dec. 5, when an appeal is to be made for the sum of £20,000, necessary to acquire and erect the proposed Furniture Trades' Colony, at Radlett, Hertfordshire.

New co-operative stores at Birtley, Co. Durham, were opened on Saturday. The premises have cost £23,000, and have been carried out by the society's own building department, from plans by Messrs. Liddle and Brown, architects, of Newcastle-on-Tyne.

LEGAL INTELLIGENCE.

A WESTON-SUPER-MARE ARBITRATION.—The award has now been published of the umpire (Mr. Charles Wainwright, F.S.I.) in an arbitration case, in which the Weston-super-Mare Gas Company offered Mr. Blackmore £700 for 2½ acres of land at the rear of the gasworks, which the company were acquiring under their compulsory powers. The umpire awards Mr. Blackmore £1,369, and this involves the payment by the company of all the costs, amounting, in view of the length of the proceedings, to a very large sum.

LONDON WATER ARBITRATION.—At the sitting, on Friday, the Court gave a decision that the sum claimed for land tax was a payment on behalf of shareholders, and recoverable from them by the company. Evidence was given by Lord Rothschild and other witnesses as to the probable value of Water Board stock; and, in regard to the liability of the companies interested in the Staines Reservoirs to contribute to the sinking fund, the Court held that, as no water had yet been obtained from the reservoirs, the companies were not at present liable. On Monday the Court further decided that the profits of the Clerkenwell estate of the New River Company are to be treated as part of the profits of the undertaking. This decision will materially reduce the amount of the compensation to be ultimately awarded. Further evidence was given as to the condition of the Staines works, and it was intimated that Sir J. Wolfe Barry, one of the arbitrators, would visit the works. The Court also announced that they found that 13 of the 54 landed properties of the New River Company were part of the undertaking, and the rest were not. It appeared that the limitation of the company's dividend to 10 per cent., if upheld by the House of Lords, would reduce the claim to £8,214,163. Argument took place on a claim for £396,255 for directors' remuneration in perpetuity, and the Court held that the directors' fees formed part of the working expenses of the company, and must be deducted from the dividend. This reduces the amended claim by £396,255.

STATUES, MEMORIALS, &c.

EDINBURGH.—The memorial erected in St. Giles Cathedral to the memory of the officers and men of the Royal Scots Regiment who lost their lives during the Boer War was unveiled on Wednesday by Lord Rosebery. It takes the form of a mural tablet, 8ft. 9in. by 7ft., the principal feature of which is a bronze central panel, 5ft. 3in. by 3ft., in which is depicted in high relief the scene of one of the regiment's engagements in South Africa. A party is engaged in storming a rocky kopje, which rears itself in pyramidal form about the centre of the panel. In the foreground is an officer leading on his men. Soldiers are storming the heights, each man trusting more or less to his own initiative. On the left corner lies a wounded Boer, not far from him is a British soldier assisting a wounded comrade, and on the right front one who lies stiff in death. Away on the left, past the kopje, is seen a glimpse of a far-stretching plain, and in the distance a range of hills with characteristic flat tops. This figure-panel is framed by pilasters of grey-green Cippolini marble, with Ionic columns. These pilasters abut again on upright tables, on which are inscribed the names of the officers and men who laid down their lives for King and country. At the top of each of these tables is the badge of the regiment—the Star of the Order of the Thistle—in bronze, with the Imperial crown. Surmounting the memorial is a pediment-shaped slab, having upon it in high relief in bronze a winged figure of "Glory," holding in her right hand a laurel wreath and in the other the trumpet of fame and a spray of laurel. The memorial was designed and executed by Mr. W. Birnie Rhind, A.R.S.A., the architectural details being carried out by Mr. T. D. Rhind, A.R.I.B.A.

WATER SUPPLY AND SANITARY MATTERS.

RESERVOIR NEAR GREENFIELD.—Plans and specifications are being prepared for the construction of a large reservoir in the Chew Valley, Greenfield. It will be called the Chew Reservoir, and will have a holding capacity of well over 100,000,000 gallons. It will be on a higher level than any of the reservoirs owned by the Ashton, Stalybridge, and Dukinfield Joint Waterworks Committee, and will be able to supply the very highest situated houses within the district supplied by that committee.

An exhibition of art applied to manufactures is being held this week in the Shire Hall, Chelmsford, closing to-morrow (Saturday). The objects are to stimulate the application of art to manufactures amongst all sections of the community; to show the results produced by the students of the Chelmsford Art Classes; and to raise funds towards the equipment and fittings of the Chelmsford New Art Buildings.

Our Office Table.

At the last meeting of the Society of Antiquaries a paper, illustrated by lantern views, was read by Mr. Philip Norman, treasurer of the society, on the "Roman Wall of the City of London at Newgate." To show the general direction of the Roman wall, Agas's map of about the end of the 16th century was exhibited, and with it a tracing from a recent map, from which the course of the wall and Medieval gates could be made out. In the middle ages the City authorities utilised the Roman wall for defence, raising it by the addition of a parapet. An analogous case of adaptation was to be seen in the bastion at Cripplegate Churchyard. Mr. Norman dealt chiefly with a piece of the old wall, about 20ft. long, which was uncovered in October, and was now gradually being cleared away. He described the structure of the wall from the foundation of puddled clay upwards, dealing with the courses on the inner and outer faces, and the bonding tiles, with the rubble filling between the two surfaces. The wall was 9ft. in height, of about the same thickness, and the top some 18in. below the level of Newgate-street. The south-west corner of the 17th century gateway was then shown. In its foundation fragments of Kentish rag, similar to the material of the wall, and tiles were discovered; and there was also found a chamfered plinth which had formed part of a Roman building, and this, Mr. Norman said, was the only portion of a Roman gateway which had yet been met with. Blocks of stone, fragments of mortar, and pieces of the plinth clamped together with iron were exhibited at the meeting. The small Roman remains met with during the progress of the works have been deposited at the Guildhall Museum.

The School of Applied Art at Edinburgh, which was recently taken over and is now conducted by the Scottish Board of Manufactures, has on view the exhibition of drawings by the architectural pupils, which will be open till the end of next week in the R.S.A. galleries at Edinburgh. The art survey undertaken by senior students during the holidays, at the instance of the school, embraces drawings of details of such interesting old buildings as Dryburgh, Jedburgh, and Melrose Abbeys, Rosslyn Chapel, Leuchars Church, Pinkie House, &c., and these, which become the property of the school, will be added to a collection which has now assumed quite a national character. The work by the outdoor sketching classes is varied, and makes an excellent show. The travelling bursars' work also commends itself by its care and thoroughness. Both bursars, Mr. A. Ednie and Mr. John Morton, are decorative artists rather than architects, and of their drawings the former includes reproductions of French furniture and decorations from examples in South Kensington, and the latter studies of cabinets and other pieces of furniture. Examples of school colour studies are also on the walls. The principal architectural teacher at present is Mr. Greig.

REINFORCED concrete tubular flooring of a new design has recently been patented and put on the market by an architect named Siegwart, of Lucerne, which is described in a report of the American Consul H. H. Morgan. The floor is essentially a combination of beams, floor, and ceiling in separate rectangular tubes from about 3½in. to 8½in. deep, 10in. wide, and 18ft. to 25ft. long. The tubes are now being manufactured in Switzerland, Italy, Germany, and Russia in factories. Moulds containing a collapsible cylindrical iron core are filled with mortar made of one part cement and four parts coarse sand. Each mould contains six ½in. to ¾in. steel rods, part of which are in the lower flange and part are bent upwards. After the cement has set, the moulds are collapsed by a screw device and are withdrawn, the beams being cut to length by a machine before they are hard. They are shipped as required to the buildings, and laid on the floor-girders to form a continuous surface like a heavy plank deck. The report states that they are now being used in all buildings at present under construction in Lucerne, and mentions seven factories outside of Switzerland in which they are manufactured.

SOME old parish books have recently been recovered by Earl Nelson and handed over for safe custody to the rector of Burnham Thorpe. The books, which were evidently stolen from the

parish chest many years ago, are especially interesting because of their association with the Nelson family, their date being at the period when the father of the Admiral was rector, many of the entries being signed by him. They turned up at a London auction a month or two ago, and were purchased by a dealer in genealogical curiosities, who promptly communicated the fact to the present Lord Nelson. We keep these things in safer custody now than was often the rule a few generations ago, and the old books, having got back to their parish chest, are not likely to be spirited away again. As Lord Nelson remarks in his letter to Mr. Briscoe, "They were not so particular in those days."

A NOTICE to owners and masters of British and foreign vessels relating to the carriage of deck cargoes of light wood goods during winter has been issued by the Board of Trade setting forth more clearly the kinds of timber permitted, and to what extent in height, upon the deck, and also the kinds of timber absolutely prohibited from being carried. Questions having arisen with reference to the interpretation to be placed upon the words "light wood goods," the Board of Trade acquaint shipowners and shipmasters concerned that they have informed their surveyors that they are willing to regard as "light wood goods" analogous to deals any goods of "light wood" the units of which are of no greater capacity than 15c.ft. All goods of light wood, the units of which are of greater cubic capacity, must be deemed to be "timber" within the meaning of sub-section 3 (a) of section 451 of the Merchant Shipping Act, 1894, which states that for the purposes of this section the expression "wood goods" means any square, round, waney, or other timber, or any pitch-pine, mahogany, oak, teak, or other heavy wood goods whatever; or any more than five spare spars, or store spars, whether or not made, dressed, and finally prepared for use, or any deals, battens, or other light wood goods of any description to a height exceeding 3ft. above the deck. The girth of all round timber is to be measured by string, and that of square timber by callipers. Any goods of pitch-pine, mahogany, oak, or other heavy wood, be the pieces ever so small, are absolutely prohibited from being carried on the deck of a ship arriving at a port in the United Kingdom between the last day of October and the 16th day of April.

THE eleventh annual examination in Sanitary Building Construction promoted by the Carpenters' Company was held at Carpenters' Hall on Thursday in last week. The candidates were representative of the United Kingdom, while one came from Hong Kong. If the candidate is successful, he will be the third member of the sanitary staff at Hong Kong holding the certificate of the company. The examiners included Professor Henry Robinson (King's College), Dr. Wynter Blyth (medical officer of Marylebone), Mr. Bartlett, Mr. John Slater, V.P.R.I.B.A., and Mr. Wilson. In addition the presidents of the Institute of Builders, the Institute of Civil Engineers, and the Royal Institute of British Architects were invited to join the examining body. The *visa voce* examination was held on Saturday afternoon.

THE full list of plans deposited in connection with Private Bills in promotion for the ensuing session of 1904 was issued on Thursday. The total is 272, as compared with 294 deposits for the Session of 1903. The applications of special interest to London and its vicinity include:—Baker Street and Waterloo Railway; Charing Cross, Euston, and Hampstead Railway; Great Eastern Railway (General Powers); Great Northern Railway; Isle of Thanet Light Railways; London and North-Western Railways; London, Tilbury, and Southend Railway; Metropolitan District Railway; North and South Woolwich Electric Railway; Harrow Road and Paddington Tramway; London County Council (Tramways and Improvements); London, Camberwell, and Dulwich Tramway; London United Tramways (Railways); Romford and District Tramway; Basingstoke Corporation; Bexhill Corporation; Bournemouth Corporation; Corporation of London (Southwark and other Bridges); Ealing Corporation; East London and Lower Thames Electric Power; Great Yarmouth Corporation; Ilford Urban District Council; Leyton Urban District Council; London County Council (General Powers); Naval Works (Portsmouth Barracks site); and Post Office Sites Bill, 1904.

NOTIFICATION is given of an intended applica-

tion to Parliament next session by the president, vice-presidents, and governors of King's College Hospital for leave to bring in a Bill authorising them and the committee of management to sell, lease, and otherwise dispose of the hospital and site. The Bill will contain clauses providing, *inter alia*, that upon any sale, letting, &c., of the chapel erected in the hospital, or any other portion of the site which shall have been consecrated as a burial-ground, the chapel and any part of the site so consecrated shall vest in the purchaser, &c., freed from all disabilities and restrictions; authorising the president, &c., and the committee to make agreements with persons having interests in the lands, &c., forming part of the site for the acquisition by the former of such interests; and empowering them to purchase, lease, &c., any lands, &c., suitable or convenient for a hospital, "and to erect and maintain on such lands or any of them a hospital, with all buildings and appurtenances which may be deemed necessary or desirable for the purposes of such hospital, and a medical college connected therewith."

At a meeting of British sculptors held in London on Saturday night, Mr. George Frampton in the chair, a proposal to form a society of sculptors was agreed to. Nearly fifty sculptors were present. The objects of the society will be to put more power behind the back of sculptors whose copyright has been infringed or who have similar legal grievances, to demand less inconvenient and expensive conditions in the competitions for which private sculptors are invited to tender work, to make it clear that sculptors are not satisfied with the off-hand treatment they receive at most public galleries, and perhaps ultimately to hold exhibitions.

MR. ROBERT BOYLE, the well-known engineer, sends us an extract from the Vienna *Faterland*, which publishes an interview with the Pope, who said:—"They say I am turned into a Grand Seigneur, because by my order two apartments were prepared for me. Now, it is true that Leo XIII. was content to live, for twenty-five years, in one small room, in which he slept, dined, and worked; but I cannot understand how he was able to do it. I need an airy, roomy apartment. But above all I must have air." That is gospel, if the arch-fiend had said it. Coming as it does from a great ecclesiastic whose words are received with veneration by one great section of Christians, and by all others with the respectful consideration due to so eminent and lovable a character, we can only hope it may quicken the crusade against the evil of all evils that saps the vitality of civilised mankind.

GEORGE TROLLOPE AND SONS AND COLLS AND SONS (LIMITED) is a new company, with a capital of £450,000, divided into 20,000 Five-and-a-Half per Cent. Cumulative Preference and 25,000 Ordinary shares of £10 each. The Ordinary share capital (except £3,000 taken up by the directors) has been taken by the vendors in part payment of the purchase-money, and Messrs. C. J. Hambro and Son invite subscriptions for the Preference shares. It is not intended to issue any debentures or debenture stock. The company has been formed to purchase and amalgamate the building businesses of Messrs. George Trollope and Sons and Messrs. Colls and Sons. The businesses will be taken over by the company as going concerns as from December 31, 1902. The purchase price has been fixed at £400,000, of which £93,000 is payable for the goodwill of Messrs. George Trollope and Sons' business and £70,940 for the goodwill of Mr. Colls's business. The purchase price is payable as to £247,000, which includes the amount of such goodwill, in Ordinary shares, and as to £153,000 in cash.

A Volunteer drill-hall, erected at a cost of £1,100, was opened on Saturday at Nunenton by General Sir John Ardagh.

A Local Government Board inquiry was held on Thursday in last week at the Barton Court Hotel, New Milton, into the scheme for the sewage of that part of the district. Mr. H. Tulloch conducted the inquiry. Mr. Rollings, town clerk of Lymington, appeared on behalf of the rural district council, and Mr. Shenton, the engineer, in support of the scheme, which was opposed by several of the landowners in the district. Evidence against the scheme was given by Mr. Blizard, C.E., of Southampton.

The additions to the Wilts County Asylum, Devizes, are being warmed and ventilated by means of Shorland's patent Manchester grates, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

LIST OF COMPETITIONS OPEN.

Elgin—School (340 places)	Hugh Stewart, Clerk, Elgin	Dec. 7
Selly Oak—Public Baths (Assessor)	A. W. Cross, A.M.I.C.E., 23, Valentine-road, King's Heath	" 7
Clare, Suffolk—Water Supply Scheme (population 1,582)	J. Bigmore, Clerk, 24, Queen-street, Haverhill, Suffolk	" 10
Herne Hill, S.E.—Public Library	H. J. Smith, Clerk, Lambeth Town Hall, Kennington Green, S.E.	" 16
Aylesford—Single-Span Stone Bridge over Medway (Assessor)	The Town Clerk, Maidstone	Jan. 1
Windsor—Elevations for Police and Fire Brigade Stations	E. A. Stickland, A.M.I.C.E., Borough Surveyor, Windsor	" 15
Wakefield—Free Library	Chas. Jas. Hudson, Town Clerk, Town Hall, Wakefield	" 20
Erdington—Council House and Free Library (Wm Henman, F.R.I.B.A., Assessor)	£50, £30, £20	Herbert H. Humphries, Eng., Public Hall, Erdington, Birmingham Feb. 1
Vienna—Machinery to Lift Bosta	100,000, 75,000, and 50,000 kronen	The Austro-Hungarian Con.-Gen, 22, Laurence-Pounteney-lane, E.C. Mar. 31
Fraserburgh—Infectious Diseases Hospital and Public Library	William Alexander, Burgh Surveyor, Fraserburgh	—
Rhyl—Pavilion (10,000 places) at National Eisteddfod	H. A. Tlby and J. W. Jones, Gen. Secs., Town Hall, Rhyl	—
Torquay—Carnegie Public Library and Municipal Buildings, Upton Valley (Assessor)	5'gs., 30'gs.	Fredk. S. Hex, Town Clerk, Town Hall, Torquay

LIST OF TENDERS OPEN.

BUILDINGS.

Nottingham—Minor Repairs in Elementary Schools (One Year)	Education Committee	W. J. Abel, Clerk, Nottingham	Dec. 5
Roche, Cornwall—Cattle House, &c.	Abel Searle	George Gow, Tregothnan Office, Truro	" 5
Sesforth, Sussex—Mortuary	Urban District Council	W. H. Pawson, Clerk, 3, Clinton-place, Seaford, Sussex	" 5
Deal—Rebuilding Five Ringers Inn	Guardians	W. J. Jennings and J. F. Duthoit, Archts., Dover and Canterbury	" 5
Croydon—Relief Station, Sanderstead-road	Hedworth, Monkton, & Jarro S.B.	Wills and Anderson, Architects, 4, Adam-street, Adelphi, W.C.	" 7
Jarrow—Additions to Dunn-street School	Corporation	T. H. Spencer, Clerk, Jarrow	" 7
Buckie—House and Chapel	Craven Bank, Ltd.	A. Tod Brown, C.E., 12, Low-street, Buckie, Scotland	" 7
Clonmel—Artisans' and Labourers' Dwellings	Co-operative Society	James J. McAuley, Architect, Clonmel	" 7
Bingley, Yorks—Branch Bank and House	Standing Joint Committee	R. Armistead, Architect, 8, Charles-street, Bradford	" 7
Ynysybwl—Bakehouse	Guardians	D. Dalis Jones, Secretary, 45, Robert-street, Ynysybwl, Wales	" 7
Berwick-on-Tweed—Rebuilding House and Shop, High-st.	Co-operative Society	W. Gray, Architect, 2, Ivy-place, Berwick-on-Tweed	" 7
Wokingham—Police-Station	Urban District Council	Jos. Morris, County Surveyor, Broadways Buildings, Reading	" 7
Croydon—Relief Station, Church-road	Urban District Council	Wills and Anderson, Architects, 4, Adam-street, Adelphi, W.C.	" 7
Ynysybwl—Bakehouse	Urban District Council	D. Dalis Jones, Secretary, 45, Robert-street, Ynysybwl, Wales	" 7
Bradford—House and Shop	Urban District Council	J. W. C. Atkinson, Architect, 1, Ivegate, Bradford	" 8
Cleethorpes—Fire Station	Urban District Council	Egbert Rushton, Engineer, Poplar-road, Cleethorpes, Lincs	" 8
Herne Bay—Alterations to Town Hall	Urban District Council	F. W. J. Palmer, Surveyor, Town Hall, Herne Bay	" 8
Bradford—Three Houses	Urban District Council	J. W. C. Atkinson, Architect, 1, Ivegate, Bradford	" 8
Glasgow—Five Cottages at Provan Gasworks	Urban District Council	Alexander Wilson, Engineer, 45, John-street, Glasgow	" 8
Keighley—Additions to Union Infirmary	Urban District Council	Moore and Crabtree, Architects, York Chambers, Keighley	" 8
Milford Haven—Laboratory at County School	Urban District Council	W. J. Wood and J. B. Gaskell, Architects, Milford Haven	" 9
Barrow-in-Furness—Additions to Cart-Shed	Urban District Council	The Borough Engineer, Barrow-in-Furness	" 9
Haltwhistle—Boardroom	Urban District Council	John M. Clark, F.S.I., Surveyor, Haltwhistle	" 9
Birdwell, Yorks—Six Houses	Urban District Council	P. A. Hinchliffe, Architect, 14, Regent-street, Barnsley	" 9
Belton—House and Farm Buildings	Urban District Council	Henry Kelsey, Architect, Queen-street, Epworth	" 10
Bingley, Yorks—Villas, Bromley-road	Urban District Council	W. Rhodes Nunn, Architect, Bugley, Yorks	" 10
Lurgan—Post-Office	Urban District Council	W. H. Stephens and Son, 13, Donegall-square North, Belfast	" 11
Norwood, S.E.—Nine Shops, Norwood-road	Urban District Council	Albert L. Guy, Architect, 4, Verulam Buildings, Gray's Inn, W.C.	" 11
Queenborough—Coastguard Station	Urban District Council	The Director of Works Dept., 21, Northumberland-avenue, W.C.	" 11
Peterborough—Extension of Post Office	Urban District Council	The Secretary, H.M. Office of Works, Storey's Gate, S.W.	" 11
Wootley—U.M.F. Church Sunday School	Urban District Council	C. Fredk. Wilkinson, Architect, 35, Park-square, Leeds	" 12
Manchester—Abattoirs, Tack-street	Urban District Council	The City Architect, Town Hall, Manchester	" 11
Gallows Plain—Alterations, &c., at Isolation Hospital	Urban District Council	W. Leonard Grant, Architect, Sittingbourne	" 11
Littlethampton—Coastguard Station	Urban District Council	The Director of Works Dept., 21, Northumberland-avenue, W.C.	" 11

FIRE-RESISTING CONSTRUCTION

NOTICE TO ARCHITECTS, BUILDERS, & CONTRACTORS.

Completely-equipped Joinery Works, Fitted with the latest and most-improved Woodworking Machinery, have now been installed in connection with our Plant for Rendering Wood Fire-resisting, and we are prepared to contract for all the Woodwork (Carpentry and Joinery), complete and fitted-up if required, for Buildings where protection from fire is desired.

The cost for Doors, Stairs, Window Sashes, Mantels, and other Joinery made of **Fire-resisting Wood** is only about 15 per cent. more than when made of ordinary wood.

We are authorised to announce that the Fine Art and General Insurance Co., Ltd., of 90, Cannon Street, London, E.C., will allow, subject to survey, a rebate of from 10 to 30 per cent. off the current rates for risks in which our Fire-resisting Wood is used.

Fire-resisting Wood Joinery is indistinguishable in appearance from ordinary wood, and when finished by us does not differ in any respect from ordinary wood, except in the one feature that it will by itself neither sustain nor spread flames.

ESTIMATES AND SAMPLES FURNISHED FREE ON RECEIPT OF SPECIFICATIONS.

ADDRESS—

The Non-Flammable Wood and Fabrics Co.
TOWNMEAD ROAD, FULHAM, S.W. LTD.

Telegrams: "ANTIPYRINE, LONDON."

Telephone, 988 KENSINGTON.

THE BUILDING NEWS

AND ENGINEERING JOURNAL.

VOL. LXXXV.—No. 2553.

FRIDAY, DECEMBER 11, 1903.

IMPROVED TYPES OF BUILDING.

PROBABLY one of the most instructive and interesting aspects of architecture as an art of evolution is the development of the many types of modern buildings, which are of such practical concern to the architect. All through the ages the specialisation of structure to meet the requirements of the time is a study of much value as it corroborates the law of "natural selection" in one department of industry. We do not address ourselves to this wider view of the theme, though it is one that ought to be made an important topic in connection with architectural education, but to the more practical lessons for the architect. He ought to give the subject more consideration by trying to discover those points of departure which make for progress where the old and new part company, or the "parting of the ways" begin, instead of trying to obscure or reconcile them. There is some particular direction of change in certain buildings. In the domestic dwelling, perhaps, the changes to be noticed are very small. The same ideas of home convenience and comfort exist as they did a century ago; but there are changes in habits of life, and these are varied in both town and country. To take the ordinary town house, the chief change will be seen in the provision of more rooms, billiard-rooms and conservatories, a better equipped suite of domestic offices, less large and rambling but more convenient, lavatories and bathrooms on the upper floors, better and more sanitary servants' bedrooms. In the planning and decoration of the chief reception-rooms and bedrooms we have lately reverted to old models, and the direction of change has rather been in the introduction of modern methods of heating and ventilation and sanitary appliances, which have not very materially altered the type of house. The country residence, perhaps, shows less development in these directions. The owner's taste is the main consideration. If he is social the reception-rooms are made a feature; if studious or of a literary turn, or of sporting tastes the drawing-room and its accompanying rooms may be sacrificed to the library or the gunroom. If there is any development of planning it is rather in the direction of the kitchen offices and their more sanitary arrangement round a court. In the smaller town dwellings, owing to the value of land, the tendency is to compress the requirements, to make the living-rooms small, and to reduce the area of kitchen offices and means of communication, such as passages and staircases. The typical suburban house in a row, semi-detached, is well known, with its front block of living-rooms and the projecting offices at the back extending into the garden in the rear. It is desirable that the architect take stock of these tendencies of present-day house-building, so that he may be able to direct his attention to those points of plan and design which are liable to be modified or are capable of improvement. The relation of entrance-hall to the several reception-rooms and staircase, the planning of kitchen and domestic offices in the most economical way with regard to their connection with the dining-room, direct communication, sanitary provision, and fire-resisting arrangements, are a few of the subjects which the architect would do wisely to keep in view in the design of such buildings, though there are many other points that are modifiable which the observant architect will find out in the design of dwelling-houses.

Not only is there the tendency of plan to change, but modes of construction alter from time to time. In the evolution of great historic buildings we have ample evidence of the influence of climate, building materials, and religion. The ancient Romans soon found that the ancient buildings of Athens were unfitted to their many-sided civilisation. Instead of the simple one-story house constructed on the lintel system, they required storied dwellings and the construction of large interiors like that of the Colosseum. They called to their aid the use of the arch and of concrete, and so a new and more complex mode of construction was introduced. Again, we find the simple peristylar temple of the Greek gradually transformed into the basilican church as we see them in Rome and elsewhere. The Cathedral of Syracuse is a good example of the changes made in the structure. The external peristyle of columns was filled up like a wall, which converted the ambulatory between the columns and the naos of temple into an aisle. The walls of naos were pierced by openings, which united the aisle with the nave, and a chancel was thrown out at the east end. The posticum of the temple became the narthex of the church. The colonnaded timber-roofed basilica of ancient Rome became, it is well known, the model for the new churches. Still more instructive was the evolution of the domical vault from such a building as the Basilica of Constantine. The square bay of the basilica was domed over, while the ends were vaulted with half-vaults, till we get the grand, unobstructed hall of St. Sophia. Again, we can trace the development of the groined vault from the intersecting vault; the introduction of the transverse arches to the simple vault led to the formation of bays, the use of diagonal ribs to the groins or lines of intersecting vaults, and the filling up of this skeleton of ribs of masonry, and the substitution of the clustered pier for the cylindrical column completed the change, and we have the groined and ribbed vault of the later periods. These and other instances offered proof of the evolution of methods of construction in the past, but we have equal achievements to show in recent times. For example, the truss is a modern invention apparently evolved from the arch principle, and most of our great modern buildings show the application of this system in the roof and other parts, while in bridge construction the truss has shown its wonderful capabilities in the spanning of rivers. And in connection with the truss principle, we have our reinforced beams and floors composed of steel bars embedded in concrete—certainly a development of considerable promise; a system of construction which can be applied to almost every building for floors and roofs, staircases, partitions, for domical vaults, external walling, chimney stacks, and also to arches and vaults. There is no limit, in fact, to its application. In its use, therefore, we have a departure which promises to change, if not revolutionise, old systems of construction, and to introduce new types.

There are a few modern kinds of building which favour the introduction of the newer methods of construction. Such buildings would include factories, warehouses, great office buildings, and perhaps hospitals and workhouses; but there are others—those which have a traditional history, like the domestic dwelling-house, municipal buildings, churches, schools, which rather adopt methods and materials which have a past. So it comes about that the newer problems of architecture, being less conservative and having no old types to follow, have a stronger affinity for the new methods of construction than the old ones, and the result is that greater progress is made in buildings of distinctly modern use. In short, the modern plan eagerly welcomes the new materials and

methods, as we see in many of our great office and warehouse buildings, in theatres and halls, and in many of the recent buildings erected for large congregations. The spacious auditorium or hall arranged for a large audience calls for the removal of all obstructing supports and columns, and the galleries must be upheld by trussed steel cantilevers encased in concrete; the roof has to be constructed with the lightest material in a flat domical form. The design is so entirely removed from all previous types that greater liberty is permitted in the style of fittings. For acoustical qualities it is necessary to arrange the seats on a certain curve, to plan the hall and fittings with special reference to sound and resonance, to use materials that will favour these objects; so the ventilation and warming arrangements require the introduction of certain appliances. The newer methods of construction have not found so congenial a home in buildings of the traditional type, and architects also have not countenanced them. Thus in certain buildings like churches it has been hard to introduce anything thoroughly novel; the designers of such buildings have been very conservative in their tastes, and hence it is that modern methods have not reacted on the older types of building to the same extent. This will account for their adhering so persistently to old models. New materials and constructive methods have sometimes been instrumental in forming a new type of building. Perhaps the most powerful factor in this way was the substitution of the arch for the beam, and its influence upon the design of churches. The substitution of, say, brick for stone or granite, would not account for any great structural alteration, though it has changed many details, and has perceptibly influenced style. This is shown by the brick Gothic of Italy. But a method of construction, such, for example, as the domical vault, has done infinitely more, and a new construction of floor or roofing would influence structure materially. On the other hand, the purpose of a building cannot be altered by either material or method; it comes before actual structure, and it is mainly represented by plan. The ancient Romans adopted Greek design as far as they could; but they soon found it too restricted for their multifarious purposes, and they invented fresh forms, which have become the types of many modern structures. The one-story temple was of little use for their active military and official life; so in the same way the American office building or "skyscraper" is a modern departure in the populous city. These are types of structure based on requirements, which must be the controlling factors. A change of material or method of construction might alter or modify their architectural expression, but it could not do more. To consider the many kinds of modernised structures in these remarks would be impossible. We have the hospital and asylum class, the workhouse class, the modern school, elementary, secondary, and technical, the laboratory for science teaching, the library, bath, museum, theatres and halls for modern assemblies, the modern hotel and residential block of flats, office buildings, workmen's dwellings, and many others in which plan and equipment are of the utmost importance, and these constitute the modifiable type of buildings. These vary from time to time. Thus the tendency to develop in the hospital class of buildings has been marked during the last decade or two. The classification and isolation of certain classes of patients has led to marked divergences of ward planning, till we find the typical plan for fever patients in such an assemblage of buildings as Hither Green, or as exhibited in Edward VII.'s Sanatorium for tuberculosis at Midhurst, where the patients' bedrooms are all separated and approached by a corridor in the rear of rooms, and have a balcony in front accessible to each patient with wide hinged casements.

The bedrooms all face south or south-east or west. Equally marked is the development of the administrative department, where every improvement for the needs and comfort of patients has been provided with means of communication by lifts to every floor of the wards. Certain typical buildings can be studied by the architect in which all the necessary rooms, for recreation and dining, consulting and operating rooms for special cases, have been planned with the greatest economy, and it is in these directions that modifications are likely to be made with the progress of experience, and for which the architect has to be on the look out. The modern school plan affords another example. The trend of education has been to adopt scientific methods, to classify students according to age and standard, to multiply classrooms, to provide for special studies, laboratories, and lecture theatres. To take these latter, education has made such rapid progress that the earlier types of laboratories have been found to be quite inadequate, and have had to be remodelled on a new plan. Chemical and physical laboratories are now required in every large school. Science teaching has progressed so much that separate laboratories are called for, besides smaller rooms used for apparatus, chemicals, a balance room, in addition to lecture and preparation rooms. The lecture-room has to be provided with seats arranged on the isocoustic curve, the plan must be designed in reference to these seats and the lecture table, and for the exhibition of specimens, experiments, models, and diagrams. So the laboratory has to be planned to provide the necessary space for benches and students, tables, sinks, draught-closets, shelves, and other apparatus. Science schools are now so necessary that the old classroom is not found sufficient for practical work. The conditions for a laboratory are good light, height and ventilation, freedom from vibration, space for benches and tables, sinks, and draught-closets, and easy passage between the benches. Other improvements and modifications may be made as time goes on, and it is the architect's business to study these, and, if possible, anticipate them. So the type of school in which science is taught will be always undergoing change. Free libraries and museums form, again, another class of modifiable buildings. The public library is a decidedly modern type of building, but one capable of modification. In these the registration and rapid circulation of books from a counter, their convenient storage in cases, and the convenience of readers of newspapers and journals, and books of more permanent value, have to be provided for by suitable rooms, stacks of bookcases, sloped desks and tables, under proper supervision. The rooms must be top-lighted in most cases, with convenient ingress and egress. A few of the more recent designs have indicated a preference for top-lighted rooms, a spacious borrowers' lobby and hall, with provisions for storage of books in the basement or top story. The combination of library and museum is often seen in many provincial towns, as at the Corporation Library at Brighton and at Folkestone, where both are worked together under one set of officials. The type of museum is more permanent. Spacious top-lighted galleries planned with reference to the cases on floor and against the walls, with ample passage room for visitors, are the main requirements. Then we have the large hotel and residential block, both buildings which have been developed during the last fifty years. We cannot say that these structures have been perfected. The improvements in various mechanical and electric appliances, lifts, motors, electric lighting, telephonic communications, are constantly leading to some modification of internal structure. Cooking arrangements and fittings have made rapid advances, requiring con-

tinued thought and contrivance on the part of the architect. In many of the larger hotels, here and abroad, the recreation and amusement of the visitors have become an item. Concert-rooms, and even theatres are, provided in the establishment—a combination of private residence with public entertainment which has added to the complexity of the design. The erection also of "flats" for residential purposes is a late departure in England, and has produced various types of arrangement in which the staircase and lift have become features. This class of town habitation promises to develop itself in the future in all our large cities. The large preaching-hall is beginning to assume in the hands of a few a distinct type of building, departing more and more from the early chapel or church type. Even in our large town churches the demand for a congregational area free from all constructional supports, and planned on acoustical principles, has become a problem with the architect which threatens, in some towns, to modify the traditional church plan. Christ Church, Brixton, lately erected for a popular preacher, is a type of plan that may be seen in many recent churches. Lastly, the modern homestead exemplifies in a remarkable manner the progress of agricultural economy. The old-fashioned farm buildings, as we pointed out last week, have been quite transformed. The large and rambling barn and adjacent sheds for livestock have been replaced by a smaller barn, where the threshing is limited to a small supply. Scientific principles of farming have altered materially the planning and relation of the sheds, and one result has been the use of covered steadings, with the food-preparing houses placed as conveniently as possible to the cattle sheds for easy consuming. A saving of the straw is effected by stall-feeding, and covered farmyards have been found to utilise, in the most economical manner, the ammonia. These changes have rapidly developed the type of new steadings; and modern labour-saving agricultural appliances have also been instrumental to the same end. Much, however, remains to be done to perfect the type of a covered homestead, not only in the collection of the refuse, but in the ventilation of the covered yards. It is needless here to discuss other buildings in which successive modifications have produced new types. When properly understood, these stages of evolution ought to suggest the lines of development or progress, and thus save much fruitless effort in design.

AMERICAN AND ENGLISH BUILDING METHODS.

COMPARING the English and American methods in the erection of buildings. Mr. Charles Heathcote, architect, of Manchester, drew a few instructive lessons in his lecture, given at the Society of Arts last week, which we reported in full. It was addressed to the Institute of Builders, and therefore the author confined his attention to the practical side of the subject. First of all, the lecturer spoke of the claim made by and for our American cousins, that of speed. We have several times spoken of acceleration of work, or speed, as hurry. As Mr. Heathcote remarks, all other things being equal, it has an exaggerated value. The English builder never boasts of his speed. All he cares for is efficiency, and, although he uses many methods for quickening the progress of his building, he rarely ever thinks speed worth putting on the same level as honest and good workmanship. A summary is given of the factors which make for rapid progress, in which a few points of comparison are noticed. There is one indictment against the English builder which has some truth in it: he is not always in earnest with his work,

and it is certainly more true of him that pleasure often comes before business, whereas with the American business comes first. Secondly, it is stated that the American architect is more alive to "rapid completion of the drawings and details of the approved scheme"; he also so arranges his construction as to promote rapid execution. "Coupling up steel stanchions tends to more rapid progress than endeavouring to provide polished granite from a Scotch quarry in winter." Thirdly, and it is quite true that early completion of drawings and details assists the contractor to organise his work as soon as possible, and this factor of progress is very often neglected in English work. The architect likes to take his time in preparing the contract drawings and details; he prefers to keep them back, with the object of giving them more consideration—a very good motive, but one which is prejudicial to the contractor's interest; whereas if the drawings and details were taken in hand earlier, or the contract postponed till they were ready, it would be a decided advantage to the builder, and the architect would obtain the extra time he required. American architects work early and late, and employ assistance to help them to complete their drawings and specifications; and the contractor spends more time in looking after the labour, and on overtime, on getting materials early. They do so because the American proprietor appreciates the importance of early completion, as meaning money to him. He does not hesitate to pay extra architect's and contractor's fees for this pecuniary advantage. Why should he? The English building owner, it must be confessed, is rather less practical and far-seeing; he makes up his mind slowly, hesitates about the design, and after he has made up his mind, he is in a great hurry to commence the work. The architect has little time to make his contract drawings complete, and hastens to have the main drawings and specifications prepared for the quantities. The American employer "values more the power of work in his employes than the amount of minimum wage," and if he can save time, will not begrudge the expense of obtaining the latest hoisting and labour-saving machinery. Then the working man takes the view, often exaggerated, that the more cheaply and speedily a thing can be produced through economising labour, the better it is for the trade. The American employer pays better wages to the men employed on labour-saving machinery, and this advances wages and finds more employment. The author compares this policy with that of our trade unions, which often compel their members to do as little work as possible. We have certainly a different view on the advantages of labour-saving in many kinds of building and architectural work. A great gain in speed and economy of production is not always or often the same thing as efficient labour and thoughtful work. The author of the paper we are discussing deals with these factors in detail, and touches on points we have raised when comparing American architectural training with our own. As we then pointed out from incontestable facts, experience, and letters in the *Times*, the American owners give an incentive to work, and men in the building and engineering branches are paid for their personal skill and devotion. The American likes work and application to business; his training commences early, and is based on technical or business qualifications, instead of merely academic acquirements as with us. Technical education is more valued than Greek or Latin. The interest of the youth is from the first bent on his business pursuit, and he thus takes more interest in his work, which is paid for according to his ability and skill. American industries and building are promoted by protection. The wages of all building operatives

are high, and home productions increase in the same proportion. In exporting manufactured goods it is pointed out a method had to be found to counterbalance the loss of exporting such goods to the Free Trade countries, and the introduction of labour-saving machinery followed. Some of our trades have been excelled; but Great Britain is still first in textiles and textile machinery.

The author points out that the American knows how to claim superiority for his work—he knows how to boast and advertise better than his English cousin; but, as a matter of fact, “the products of our Yorkshire mills are not equalled anywhere in quality and finish. Our carpets, cottons, cloths, the precision of our machinery, our shipbuilding, pottery, and cutlery are still unbeaten.” But it is admitted that though in quality and finish we are unbeaten, we are backward in introducing new ideas and improvements. The author, when staying at New York, admired much the finish of the baths and lavatory appointments and plumbing work in his hotel, but found out, to his astonishment, that a London firm had done the work. As the author says: “If this had been reversed, every newspaper in England would have contained an article on American enterprise, with gushing accounts, possibly paid for, about the decadence of the sleepy English sanitary engineer”—an instance which shows the reserve of English manufacturers compared with their self-advertising cousins. Our self-satisfied conservatism, the idea that what did for our grandfathers and made their fortunes ought to be good enough for us now, and that we could hold our own, has been our cause of failure. Recent competition with America has shown us forcibly the mistake of this position, and that we no longer can claim to possess the “workshop” of the world. Our methods are not the same. A Britisher going to the States soon adopts the quicker actions of the country, and it is a fact that the best brickwork in New York has been done by British bricklayers. The work is done under a different system, in which economy of labour and mechanical aids are combined, and the output is greater. The American workman has a greater inducement to work: he is encouraged in discovering new ideas and methods, whereas with us he is kept in a sort of groove, and is not assured of remuneration. But with us, as Mr. Heathcote says, it is not the highest speed that is wanted, but the old good workmanship and well-organised method. In building there is no superiority of American over English work; the former is done often by night by means of flares, ours generally in the daylight. Yet the architect, too, in America is more interested in his calling, and has a keener business and working capacity. Our younger men, at least, have not realised the importance of time saved in building and the profit attached to quicker use of it. The lecturer does not undervalue the advantages of time and leisure, or of slow construction in certain cases where speed would be risky, as in wall construction and foundations, but he lays stress on the necessity of furnishing the contractor with his drawings and details, and he further advises our younger men to fill the ranks of superintendents of buildings in our larger and more important works. The clerk of works is, of course, a valuable and much-needed official on all works, to check materials and to keep a watch on the daily progress of a building; but superintendence of a more special kind is necessary in some cases, which can only be secured by a highly-trained assistant, or a specialist in steel construction, as may be required. There may be several such supervisors to take sections of the work, under general control of the architect. These superintendents should be required to look forward in their particular section, and see that everything is ordered in time. The author says, on his own work, he

has “progress” plans, with the dates upon which certain parts are expected to be completed, the superintendent of each part seeing that the instructions are carried out. Every part of the work can be mapped out upon a well-organised plan in this manner. Many instances are noticed, to which we refer the reader. It is very true that a certain rate of speed in a building depends upon the relative cost. A low tender, if accepted, can only be carried out to pay the contractor by allowing a certain rate of speed. It would not be fair to expect a higher rate than that at which the contractor can make a profit. It is all the tenderer expected to do, and it is on this understanding the majority of contracts are let in America. So that on this ground, if a building is to be erected quickly the owner must be prepared to pay at a higher rate. The American building owners act on this principle: if they wish for speedy erection, they are glad to pay for it. But although the principle is adopted in this country, owners and building contractors do not act upon it in a business way. Given the same rate of payment and the same conditions, an English contractor will work as quickly and as well as an American.

Referring to English practice, Mr. Heathcote also mentions the number of bricks that can be laid per day. At the Westinghouse Works, Manchester, under the supervision of the author and Mr. Rodd, one of the first engineers of America, 1,600 bricks were laid per man per day, and this number has been laid at Parr's Bank in that city, on a two-brick wall with ordinary bond, set by trowel in mortar; but this tale of bricks was not the average. In the former building there was no general contract. All heavy work was at per ton, per foot cube, or square yard; the excavating was let to one firm, the steel to another, slating to another, &c.—all English firms. But the author shows there was a large portion of the work done and material delivered, and railway tracks put down, foundations prepared, and steelwork in readiness, before an American contractor came on the work as an official of the company. The work was rapidly proceeded with, and by time being saved in preparation the company benefited. Every drawing was ready, and nothing to wait for; extra wages were paid, and the best hands employed; and so any work can be accelerated by having the bricks and materials ready and to hand, and men encouraged to do the work by extra wages, with bonuses for work done against time, and plenty of superintendents and foremen. So much for speedy results. The author observes: “There can be no criterion of how many bricks can be laid in backing stone-work, in erecting buildings partly stone and partly brick; but in ordinary stock-faced building with stone dressings, internal walls with usual doorways, arches, fireplaces, flues, beam fitting, if a bricklayer averages 700 English bricks of common brickwork per day of 10 hours he is doing a fair day's work for 8s. 4d.” Other data are given in the paper on this question of bricklaying of general interest. On the question of heating buildings a few useful remarks are made. These go to show that we should have continued in complacent satisfaction had not the American and Continental engineers forced our heating-apparatus makers to keep pace for their own benefit, till now we have cast sectional boilers and radiators equal to either American or French. We commend the paper to all our readers, especially now when so much has been said and discussed upon our industrial output and the question of labour as applied to building operations. Government interference by Factory Acts, rules, regulations, &c., has been detrimental and hampering to our industries, for, as the author of the paper says, the first brickmaking machines invented in England were placed under a ban, and the men who worked on them were murdered,

and the contractors of the Manchester Town Hall about thirty years ago had to obtain police protection for their men who carried bricks without the ordinary hod; but it is the old story of prejudice and vested interests.

THE ARCHITECTURAL ASSOCIATION.

THE fifth ordinary meeting for the current session of the Architectural Association was held on Friday evening at the R.I.B.A. rooms, 9, Conduit-street, W., the President, Mr. H. T. Hare, F.R.I.B.A., in the chair. Messrs. C. J. Stewart, B. H. Colcutt, and P. G. Crawley were elected as members. The President announced the following additional donations to the New Premises Fund: Mr. C. P. Selby, £5 5s.; Mr. H. W. Lonsdale, £5 5s.; Mr. W. C. Butterworth, £3 3s.; Mr. Geoffrey Lucas, £3 3s.; “L. F.,” £2 2s.; Mr. J. W. Wyles, £2 2s.; Mr. H. W. Braddock, £1 1s.; Mr. J. B. Gridley, £1 1s.; Mr. A. S. Hewitt, £1 1s.; Mr. H. A. Legge, £1 1s.; and Mr. E. F. Cobb, 10s. 6d. A vote of thanks was accorded the donors. Mr. LOUIS AMLER, Hon. Sec., stated that at the meeting of the Discussion Section on the 16th inst. (Wednesday next) a paper would be read by Mr. A. O. Collard on “The Work of an Exhibition Architect.” He proposed a vote of thanks to Mr. Maurice B. Adams for the donation of some mounted prints of 1834, 1836, and 1857 of the Royal Architectural Museum, its casts, and a lecture given in that institution by Mr. Ruskin, which were shown on a screen; and also proposed a similar motion of thanks to the donors of the following lantern slides:—51 of Gothic work, presented by Mr. E. W. Wonnacott; 27 of Classic and Gothic work, by Mr. G. H. Lovegrove; 48 of Gothic and Renaissance, by Mr. Alan Potter; and 5 of Beauchamp House, Shoplands, Essex, by Mr. J. G. Gittins. A similar vote of thanks was passed to Mr. B. T. Batsford for the gift to the library of “The Drainage of Town and Country Houses,” by Mr. G. A. T. Middleton.

PHOTOGRAPHY FOR ARCHITECTS.

A paper on this subject, illustrated by numerous photographs and sketches, and by about a hundred lantern slides contributed by members of the Camera and Cycling Club, was read by Mr. FRANCIS R. TAYLOR. The lecturer remarked that there are many in our midst who consider that photography is opposed to the best traditions of the study and practice of architecture. It is, therefore, he added, my purpose to put before you facts which will prove that photography for architects possesses a value both in the study and practice of architecture which cannot be overlooked. The subject will be dealt with under two main heads—viz.: The utility of photography in (1) the study of architecture, (2) the practice of architecture, and the apparatus and appliances for architectural photography will then be briefly considered.

THE STUDY OF ARCHITECTURE.

The usefulness of photography in the study of architecture will be considered with reference to its value in educational work, and also to its value as a record of old work. Photography in its application to the study of architecture is simply a means of delineation, and it is the finished photographic print or lantern slide which is the valuable aid to study. Photography should not be considered as antagonistic to sketching. It has a utility in the education of the architect by producing an accurate delineation of old buildings unattainable by a sketch. It must not be forgotten that however valuable a sketch or measured drawing may be to the individual student who prepared it, there is the personal error to bear in mind when this method of delineation is applied for general study.

MEASURED DRAWINGS AND CAMERA WORK.

Photographs in conjunction with measured drawings undoubtedly form the best means for architectural study and research. It may be mentioned that in the “Architectural Association Sketch Book” there are examples of measured drawings, together with a photograph of the work. This method of illustration might be employed with advantage to a much larger extent, not only in the Sketch Book, but in all architectural publications. Whenever any old building of interest is to be pulled down to make way for modern improvements or for other reasons, a set of measured drawings with a series of photo-

graphs form the best record of the old work. In record work research should be made as to how the building has fulfilled its purpose and how its environment affected its design. To obtain this knowledge the employment of photography is a valuable assistance.

LANTERN SLIDES FOR CLASS TEACHING.

The method adopted for the training of architects by a system of instruction in classes has its value considerably enhanced by using photography as one of the means of illustration. The use of the lantern-slide in lecture work is a great step in advance of the ordinary lecture diagram. It is essential, in order to make the instruction imparted by lecture work of the greatest value, that the illustrations employed should receive concentrated attention whilst the various points are being explained. Diagrams specially prepared for lecture work are in the majority of cases of but little avail, and it is impossible for the lecturer to satisfactorily explain from them, even to an average-sized class or meeting, the various points dealt with, simply because they cannot be properly seen from every part of the room, and, besides, in most instances, are badly placed for the lecturer's use. Frequently the walls of the room are smothered with measured drawings, plates from the building papers, and similar illustrations, and an attempt is made to explain some points when only one or two present can see the illustration referred to. One does not object to illustrations of this kind on the walls if they are simply intended for those present at the meeting to see for themselves before or after the lecture, but to use them as lecture diagrams is really the height of absurdity. But all these difficulties are obviated by employing photographic means. Lantern slides of the actual work, of measured drawings, of illustrations from books and other publications—in fact, of illustrations from every available source—can be thrown upon the screen, can easily be seen by everyone, and enable the lecturer's explanation to be understood by all. Lantern-slides for architectural lectures should be made with a view to suitability of purpose. Photographs of buildings, both externally and internally, would be useful to illustrate the grouping and general effect, and then should follow photographs of towers and spires, of piers and arches, of eaves and bases, of doors and windows, of vaulting, &c., to illustrate the treatment of the parts, and, lastly, of mouldings and ornament. If a systematic sequence is followed, the slides would be of immense value in promoting the study of architecture. In illustrating constructive subjects, the same principles should be adhered to—explanatory lantern slides to illustrate the manufacture and uses of the various materials, and then slides showing the different methods of construction. Measured drawings, sketches, book illustrations, and, in fact, every process of delineation can be brought within the scope of the optical lantern. The possibilities of the usefulness of the lantern-slide in educational work is practically unlimited. The slides themselves should on no account represent more than is required. Simplicity should be our guide in these matters. All diagrams and book illustrations should be represented on the screen as large as possible. The attempt to crowd many illustrations in one slide should be condemned. A lantern-slide for lecture purposes should not consist of a confused jumble of details with meaningless letters or figures. It is bad enough in a text-book, but infinitely worse in a lantern-slide. The object of all study is to gain knowledge, and not to cause confusion. The use of telephotography in the study of architecture is one which should receive our careful consideration. In many instances parts of a building well worth studying are inaccessible for measuring, and in those cases an ordinary photograph gives a general idea of the composition and a telephotograph the details.

THE PRACTICE OF ARCHITECTURE.

The utility of photography in the practice of architecture might receive far more attention than it does. In many instances the only use to which photography is put in architectural practice is in the reproduction of drawings by the ferrographic process. In this process the reproduced drawings are either on a thin paper, or on a paper similar to Whatman's, and a black or brown line is obtained on a white ground. The advantage of the process is that the reproduced copies can be coloured similarly to an original drawing. A great saving of time is effected, because from one complete set of tracings any number of reproductions can be obtained. If the reproductions

are to be kept for a considerable time, as in the case of copies for the authorities, care must be taken in the selection of the paper, owing to its tendency to fall to pieces after a time. For this reason the authorities will only accept photographic reproductions on linen. The makers of the paper might consider the best means of surmounting this difficulty. It may be mentioned here that some of the papers used shrink slightly in the process of obtaining the reproduction—this emphasises the necessity of fully dimensioning all drawings. The ferro-prussiate process with a white line on a blue ground is sometimes used, but as colouring is then out of the question, it is not so suitable for general architectural work. Its use is limited to drawings where colouring is not essential, as, for instance, in details of steel construction. Besides this special application, the use of photography in architectural practice is generally limited to what may be termed the legal phase of our profession, although a wider application would be a distinct gain. No one will deny that photographs of buildings about to be pulled down are valuable records, and in ancient light, easement, party structure, and such-like cases would always be useful on one side or the other. If the building happens to be one of considerable architectural interest, then the value of the record cannot be overrated. In modern work, photography could be used to increase our knowledge and experience in a way little thought of, and the wonder is that it has not been more generally applied for the purpose. Photographs of a building at its various stages of erection, with the dates, and in some instances the time, noted thereon, would be a valuable record of the class of work, and, in addition, would be very serviceable in the valuation of certificates. Photographs of special works of construction in buildings of a distinctive type would be most useful for future reference when dealing with similar works. Photographs of the finished building should in all cases be obtained, and a comparison made by showing the photograph side by side with the perspective drawing. With reference to comparisons, a collection of photographs of similar detail and ornament of old and modern work would prove of use both in the study and practice of architecture.

THE PRACTICAL USE OF PHOTOGRAPHY

in delineating the progress of a structure from time to time is employed by engineers with the best results, and there is no reason why we should not do likewise. In a few isolated cases it is done; but it res's with the profession at large to avail itself of the opportunities within its grasp. This legitimate use of photography in our everyday practice would assist in grappling with many difficulties with an ease at present unknown. The utility of photography in the study and practice of architecture having been dealt with, it now remains to deal with the technical part of the subject. It is evident that in order to obtain the best results in the application of photography to the study of architecture that the taking of the photographs should be performed by ourselves, otherwise the photographs or lantern slides will not express the subject in the best way. It is impossible for a professional photographer to know exactly what is wanted unless he happens to have made a thorough study of architecture, and we know that in the majority of cases he has simply a mere smattering of our requirements. If his speciality is architectural photography, his knowledge of architecture may, in a general way, be said to be peculiar, and not, by any means, extensive. Consequently, if the work is to be done well, the photographs and lantern slides should not be left in his hands for selection of subject. There may be exceptions, but the exceptions prove the rule. It might, of course, be urged that the professional photographer could do the work under our guidance; but it will be found that this method is expensive, and is, in reality, only applicable in those instances where selection of subject is not required to any great extent.

RECORD WORK AND ITS RECORDER.

It is desired to make a thorough record of an old building. Here the best way to proceed is to make measured drawings of the building, and a complete series of photographs. Who is most capable of taking the photographs? Unquestionably, he who undertakes the recording of the old work. Again, in detail and ornament, who knows which is best to select for architectural purposes? Certainly not the professional photographer, for he would be in a state of bewilder-

ment, whereas the architect would not have the slightest hesitation about the matter. In the many requirements of architectural practice where the question of architectural selection does not arise, the photographic work can with advantage be delegated to the professional photographer. The architect who decides to use photography as an aid in his study and practice should understand

CERTAIN TECHNICALITIES OF PHOTOGRAPHY.

The questions which present themselves are:—What is the best camera for architectural work? What lens should be used? What photographic plates and papers should be employed? Dealing with the questions in order:—Firstly, What is the best camera for architectural work? Before anything can be done, the size of the camera must be decided upon. The ordinary sizes are: 4½ in. by 3½ in. (quarter-plate), 6½ in. by 4½ in. (half-plate), 8½ in. by 6½ in. (whole plate), 10 in. by 8 in., and 12 in. by 10 in. It is generally agreed that the larger the size the more expensive it will be. Besides this, the weight of the camera is a serious matter, especially as in the majority of cases the work would be done at a distance from home. For these reasons it may be conceded that the half plate is the most serviceable. When lantern-slide work is contemplated, the quarter-plate is generally selected, as that is the most suitable size for the purpose. If a good lens is employed, the quarter-plate size might be used for all work, as the photographs can be enlarged with satisfactory results.

THE REQUIREMENTS FOR A GOOD CAMERA

are:—1. Lightness, with rigidity. 2. Rising and falling adjustment to the front of the camera. 3. A reversing and swing back. 4. A long extension. 5. Parallel bellows, or only slightly conical. 6. Focussing screen and focussing adjustment. 7. Double dark slides. The lightness of a camera is necessary for convenience in carrying about, and rigidity is required to prevent movement whilst the photograph is being taken. The rising and falling adjustment allows the position of the photograph on the plate to be varied. In architectural work a considerable rise is frequently required. The reversing back is essential in order that the photograph can be taken in a horizontal or vertical position. In many cases the camera must be tilted to include the whole of building, hence a swing back must be provided, for the plate must be kept vertical, otherwise the vertical lines of the building would converge in the photograph. A long extension provides for the use of a long focus and telephoto lenses. Parallel bellows prevent the cutting off of the edges in the photograph when a short-focus lens is used. The focussing screen is the sheet of ground glass upon which the photograph is depicted. It is adjusted to obtain a clear, sharp image by means of a rack-and-pinion movement. The double dark slides hold the plates for exposure, and at least three, or, better, six, double dark slides should form part of the outfit. The questions to decide in the selection of a tripod stand is one of rigidity, compactness, and portability. Secondly: What lenses should be used? It is best to provide in an outfit for architectural work a set of lenses of different foci and of a good make. The lenses should be of a rectilinear type. For average work the rapid rectilinear of about 7 in. focus is most serviceable on a half-plate. Long-focus lenses are useful in detail work, and wide-angle lenses are essential in confined positions. The telephoto lens would be a most valuable acquisition in the equipment. Some of the best examples of detail work are at too great a distance from the position available to give a photograph of a satisfactory size; but a telephoto lens enables you to obtain it to a larger scale with the same extension of camera. As this lens is not of a fixed focal length, the scale of the photograph can be altered at will. Thirdly: What photographic plates and papers should be employed? Ordinary plates of a good make are the best for architectural work, especially for interiors, although in dark interiors, where very long exposures are requisite, rapid plates may be used with advantage. Isochromatic plates are useful where the lighting of the interior is yellow. In interiors where the light from windows, &c., would be likely to cause halation, it is necessary to use backed plates.

THE DEVELOPMENT OF THE NEGATIVE

requires care on the part of the operator; but this question cannot be discussed now. It may be mentioned, however, that the architect—

photographer should do his own development, and not follow the advice expressed in the well-known advertisement phrase of "You press the button, we do the rest." The chief printing processes can be classified under four heads—viz., (1) Silver printing-out processes; (2) platinotype; (3) carbon; (4) bromide; and the decision as to what processes should be adopted depends upon circumstances. A silver printing-out process, such as the well-known P.O.P. of various makes, produces excellent results; but if permanent photographs are required, then platinotype or carbon processes should be used. For enlargements bromide papers are most satisfactory.

The lecturer proceeded to describe in detail the processes of developing and printing out photographs, illustrated by examples on the walls of various methods, and added:—The architect photographer being fully equipped, now sets forth to take photographs. He makes a selection of some old buildings, and if he be an earnest worker he does not, as is often thought, make a tremendous rush at it. Whilst long exposures are being given, he devotes his time to finding out all he can about the building, and maybe he measures details and obtains full sizes of the mouldings. It seems to be a stock argument for the opposers of photography for architects to refer to the inverted image on the focussing screen, as if that were the important part in studying the work. That is only a means of obtaining a good photograph, and as to the inverted image, one gets used to it in precisely the same way as our minds have been able in infancy to correct the impression of the inverted image which is produced on the retina of the eye. And now, in conclusion, it is hoped that the various points raised will be fully discussed in an impartial spirit. The great question before you is the utility of photography in our study and practice. The value of combining photography with measured work should receive a large share of your attention, and encouragement is much needed for architectural research, and in giving it every method of delineation should be recognised, together with a clear description of the work and its history.

Mr. ARNOLD P. MITCHELL, in proposing a vote of thanks to Mr. Taylor, said he was hopelessly opposed to the lecturer's views as to the relative value of sketches and photographs in the study of architectural detail. Sketching and measured drawing were the best possible practice for the young architectural student, who ought to leave photography to the older man, who had no leisure to spend on a building. As soon as a young architect obtained a camera the use of the pencil was abandoned. The trained architect who did employ photography had an enormous advantage over the professional photographer, in that he knew what was worth taking, and the point from which to take it. He exhibited on the screen half a dozen slides taken with a three-quarter plate camera by an amateur, which he thought were superior to any that had been shown that evening.

Mr. GEORGE SCAMELL feared that if architects adopted Mr. Taylor's hint and photographed freely from published works they would soon find themselves involved in copyright difficulties. In photographing monuments and buildings, it was a very great advantage to introduce into the view a clearly marked scale. Such a measure broadly defined in English and French dimensions to a metre and a yard was issued by the Society of Antiquaries at 6d., and would be found very useful. His own practice was to invariably use a whole-plate camera, stopping it down with cardboard screens to the required size. To the camera a little plumb-bob and string could be added for 3d., and was most necessary for architectural work. The camera should have square bellows; the lens, which must be astigmatic, should not be in the centre of plate, but as high as possible, so as to reduce the foreground, and obviate raising the front. As plates were heavy, he used Wellington Ward's films, and this prevented halation and reduced the weight of kit to 12½ lb. as against 18 lb. when plates were carried. For developing, ortol was quite as good as pyro, and did not stain the fingers. The only safe material for mounting was starch paste. In exposures he would advise the beginner to err on the side of overdoing it; but the water meter was a very good test for light.

Mr. HUGH STANNUS remarked that Mr. Arnold Mitchell had added a new terror to lecturers by bringing a few picked slides to take the shine out

of the lantern illustrations. For taking details in vaults and other inaccessible places he had a swivelling reflector, which hooked on to the front of his camera, and enabled him to get the floors and roofs of tombs, and also ceilings. At the University College, Liverpool, Professor F. M. Simpson had the surface of the wall in his classroom which was pierced by windows, and was therefore the darkest, prepared, so that the lantern faced this, and the students could see the views, and yet had sufficient light to take notes of the lecture. The suggestion might be borne in mind in fitting-up the Royal Architectural Museum. He did not agree with Mr. Taylor in his advocacy of the lantern for studying constructional details. For examining beams and girders slides were useless, whereas models were all important. The comparison of two points, or of a plan and building was difficult with the lantern. Two lanterns projecting on the same screen were sometimes employed, but the expense and inconvenience were very serious objections, and perhaps the best plan was to rephotograph both on the same slide. While a student was watching his chance, say, for forty minutes, to take a dark interior, he should be sketching or studying the work, so as to let the impressions soak into his mind.

Mr. JOHN D. CRACE observed that the lecturer had not referred to what was certainly one of the most valuable phases of architectural photography. A student could examine a photograph or slide slowly and at leisure, and thereby see far more than could be realised in the building itself. He remarked how the late James Fergusson showed, after long study of photographs of the Erechtheum at Athens, various slip joints and other evidences of change of plan on the part of the builders. Such details might escape the most observant man while on the spot, but were comprehended by careful study of the photograph. Half the success of a good photograph depended on the selection of an appropriate light to suit the subject.

Mr. E. W. WONNACOTT advised the young photographer to purchase the best lens and other tools that he could afford. He wished Mr. Taylor had shown only half the number of slides on the screen. It would have been easy to have selected half a dozen quite equal to the picked ones brought down by Mr. Arnold Mitchell.

The PRESIDENT, in putting the vote of thanks, with which the name of Mr. Wonnacott was coupled, and which was heartily accorded, urged that photography should be an assistant and not a substitute for sketching and measured drawings. As a matter of fact, they all knew that Mr. Mitchell was a sketcher *par excellence*, and had taken that evening rather an extreme view as to photography; a medium course was the safest. No young architect should employ a camera until he was out of his pupillage. A measured drawing followed by a photograph would give absolutely the best record that could be made of a building or monument. The disadvantage of lantern-slides for lecturing purposes was the transient nature of the study. Mr. Taylor had not dwelt on the great value of photographic records in light and air cases, and for questions of progress of work at stipulated dates.

In acknowledging the vote of thanks, Mr. TAYLOR remarked that Mr. Mitchell was an admirable draughtsman; but he did not despise the use of photographs to illustrate his excellent lecture on architecture. He agreed with Mr. Wonnacott that if an architect took up photography, he should procure the best tools and turn out the work thoroughly well. For lantern lectures it was only necessary to darken one-half of a room, and enough light would be left to enable the students to make notes.

THE STATUTORY REGISTRATION OF ARCHITECTS.*

THE protection of the profession of architecture from unqualified practitioners is by no means a modern conception. So far back as the days of Vitruvius, the celebrated architect, complaint is made of irresponsible and uneducated men practising the art. He says in the introduction to his sixth book:

When, therefore, I see this noble science in the hands of the unlearned and unskilful, of men not only ignorant of architecture, but of everything relative to buildings, I cannot blame proprietors, who, relying on their own intelligence, are their own architects.

And in his tenth book, referring to the manner in

which the City of Ephesus dealt with incompetency, he says:

Would to God that such a law existed among the Roman people, not only in respect of their public, but also their private buildings, for then the unskilful could not commit their depredations with impunity, and those who were the most skilful in the intricacies of the art would follow the profession.

I do not propose to occupy your time at any great length this evening, but desire to point out as briefly as possible the main features and progress of the movement we are now met to discuss. In introducing my subject, I must necessarily go over some ground with which some of you may be familiar; but for the benefit of those to whom the question is new, I should like to define

WHAT WE MEAN BY REGISTRATION.

In the present it means that every man practising architecture shall be enrolled in an official register under an Act of Parliament, and be responsible for his professional actions, and that no one be allowed to practise until he is duly enrolled. In the future it means that no one be allowed to practise architecture until he is duly qualified, and has been found so by undergoing a qualifying examination. It means, in fact, little more than making the Institute examination compulsory by Act of Parliament. It is a matter for surprise that this obvious benefit should not have been secured to the profession long ago, seeing the advantage a qualifying examination has been to the learned professions of law and medicine.

WHY IS THE REFORM NECESSARY?

There is a vague notion among the general public that architecture is one of the fine arts. This is all very well as an abstract theory; but when it comes to the practical application of architecture, and the actual individual who is to translate the theory into practice, the public know very little how and by whom it is done, and, I think, care less. The profession, as it is styled by courtesy only, is not looked up to and respected, contrary to the learned professions just mentioned, and I think if we look at the present position and practice of architecture in this country we shall find a reason. Any person with or without a fair general education, any builder, builder's foreman, clerk of works, clerk in a Local Board office, auctioneer, undertaker, &c., with the sole qualification of being able to provide a brass plate, is at liberty to advertise himself as a person qualified to give advice to the public in the science and art of architecture. We in London suffer from builders, decorating firms, and others who, going out of their proper province, boldly proffer their services as architects to their customers gratis, and the apparent saving of five per cent. is not to be resisted. Some firms even go to the length of announcing that a competent architect is kept upon the premises—I suppose like the shopwalker. Can it be a matter for wonder that architects are still unrecognised while such a condition of things exists, for at present the public have no guarantee that the class who call themselves architects are any better qualified to plan and design their buildings than the contractors who erect them, and should they employ an architect they have no means of ascertaining that his knowledge is greater than that of the builder, and the only certainty about it from their point of view is they will have to pay the professional charges.

WHO IS TO CARRY OUT THE REFORM?

I have no hesitation in saying that if this thing is to be done the Institute has to do it. It is not my intention to-night to say one unkind word against the Institute; but I would like to venture on a little friendly criticism and point out how far it has gone in the direction of registration. The Council of the R.I.B.A., in its session of 1859-60, drew up a special report on an Architectural Examination, from which the following is an extract:—

The ultimate result should, in their opinion, be the establishment of a system of compulsory examination extended to all architects, whether members or not of this Institute.

It also states in the *Kalendar*:—

The R.I.B.A. desires to obtain for all those entering the profession a systematic course of education, thereby laying a foundation of artistic and scientific knowledge, upon which to cultivate any natural gifts and develop any aptitude for invention or design he may possess.

On May 3, 1890, it passed the following resolution:—

That while not opposed to the principle of compul-

* A paper read before a meeting of the Manchester Society of Architects, by Mr. ELLIS MARSHALL, on Dec. 10, 1903.

8017 examinations as applied to those about to practice architecture, the Institute is of opinion that the difficulty of restricting by statutory powers the practice of architecture to those who have passed an examination is at present so insuperable, that it is undesirable to make an immediate application for such power.

To what does this resolution amount but the admission that the principle is a good one, and that the difficulties in the way are the only bar to progress? Why do we band ourselves into societies and associations unless it be for the express purpose of overcoming difficulties and bringing about reforms for the general good? More than two years ago the then President of the R.I.B.A., in his inaugural address, urged the Institute to follow the lines of the Incorporated Law Society as regards solicitors, his remarks being thus commented on in the *British Architect* :—

If this is not Registration pure and simple we should like to know what is. In the light of this pronouncement of the President we really fail to see the force of the Institute's opposition to the Architects' Registration Bill: in principle and essential particulars it is on much the same lines as the President's proposal.

Again, Sir William Emerson, P.P.R.I.B.A., is reported to have publicly stated that :—

What was wanted was that the status of the architect should be more clearly defined, and to this end it would be a good thing if Parliament were able to pass some measure by which their town and country should be prevented from being disfigured by the work of builders without guidance, or by men who had absolutely no justification for practising as architects.

The latest presidential announcement is, however, of a passive-resisting type, and states that "inaction on the part of this Institute has been deliberate and intentional." This inactivity is placing the Institute in a false position, and is causing a vast amount of dissatisfaction, especially among provincial members, as the want of such a measure of reform is felt far more keenly by them than the London men. The necessity for a higher standard of professional excellence and public confidence is of essential importance to provincial men. There is a feeling—a mistaken one, if you will—that local architects are all very well for the ordinary work of the town; but as soon as any work of primary importance is to be executed architects from outside are invited to compete. Does not this arise partly from a want of confidence, there being no guarantee in employing a man who is styled an architect that he really knows his business? But nine cases out of ten it is the local man who, from his knowledge of the materials of the locality and the special requirements of his fellow townsmen, is more likely to carry out the work satisfactorily than an architect from a distance. Of what use is it for the Institute to say that its examination is a panacea for the existing evils, unless this examination is made compulsory? Until men find that by undergoing a course of study and passing an examination they are placed in a better position in the eyes of the public than the man who possesses no qualifications at all, it is very unlikely that an appreciable number of men will voluntarily come forward and avail themselves of this means of entering the profession.

THE ATTITUDE OF THE "MEMORIALISTS."

I can quite understand the attitude, although I do not agree with the opinion, of the coterie of art men who, in a memorial addressed to the Institute in 1891 and quoted by the President in his address, said :—

That a diploma of architecture would be a fallacious distinction, equally useless as a guide to the public and misleading as an object for the efforts of the student, and that no legislation can protect the public from bad design.

The attitude of these gentlemen is at least logical, because they don't believe in any examination at all. But where an examination is a settled policy it is absolutely illogical to hind heavy burdens on the backs of its student members in the way of a difficult and prolonged course of study and examination, and then to offer them nothing in the way of protection from the man who has passed no examination at all. The only logical sequence of education and examination is protection and registration, or why have any examination at all? Did it ever strike you what an incalculable amount of harm this voluntary examination is doing? You know as well as I that by far the larger number of candidates fail to satisfy the examiners, and what becomes of these? They are not debarr'd from practising, as they would be under a Registration Act; but they are let loose half-educated, and a menace to the public and a discredit to the profession for which they have imperfectly fitted themselves. ~

THE ATTITUDE OF THE PROFESSION TOWARDS THE MOVEMENT.

We are informed, but upon what authority I do not know, that there is a considerable body of opinion strongly against the movement, and that it is outside the realm of practical politics. This I deny. What are the facts? From a recent poll of the profession, *i.e.*, of all members of any recognised Architectural Society, more than two-thirds replied in favour of Registration, only 170 replied as opposed to it, and the balance, I think we may fairly assume, were either indifferent or had not sufficiently thought out the subject, and therefore did not reply. Your worthy President has taken the trouble to obtain the general opinion of the Allied Societies, and I quote from his address :—

In order to ascertain the general feeling on the subject, I have invited the opinion of the various societies in different parts of the country, and out of twelve from which I have received replies, six were in favour of registration, one against, two were divided in opinion, and three had not discussed the question.

The President of the Northern Architectural Association, Mr. J. Walton Taylor, F.R.I.B.A., in his opening address, says :—

With regard to Registration, the allied Presidents were in favour of it, but thought the Institute was the proper body to take the subject up.

Mr. Butler Wilson, President of the Leeds and Yorkshire Architectural Society, said in his opening address :—

I hope at the next election of the Institute Council that the question whether candidates are in favour of Registration or no, will be rendered even more acute than at the last election when, without organised effort, we succeeded in placing thirteen declared registrationists. There are still about a score members who are neutral. But we must insist on their declaring themselves one way or the other, so that we may know which way to vote. You cannot get anywhere by neutrality. It is not a quality which makes for advancement. To render the co-operation of the allied societies effective, I shall propose an association between us which would make Registration the crux of the next elections.

Again, meetings have been held in the following towns: Cardiff, Bristol, Exeter, Leeds, Liverpool, Manchester, Birmingham, Newcastle, Sheffield, Edinburgh, Glasgow, at all of which resolutions were passed, with some few dissentients, in favour of the proposal. The Royal Institute of Architects of Ireland has decided in its favour, and has intimated that if the English Institute will not do it they will do it themselves.

THE FEELING ON THE CONTINENT.

What are our Continental brethren doing in the matter? (1) The Fourth International Congress of Architects, held at Brussels in 1897, by a unanimous vote agreed to the following resolution :—

That the architectural societies should unite, and conduct an energetic campaign to obtain from their Governments the institution of the diploma.

(2) The Fifth International Congress of Architects, held in Paris in 1900, passed a resolution, which was unanimously adopted, to the effect :—

That Governments should take steps to protect and secure respect for the title of architect by reserving it for the future, and without retrospective action, for architects provided with a certificate of capability, or by forbidding its use by others; and, further, should place such certificate within the reach of all by the spreading of special architectural education and training.

(3) The States of Iowa, Illinois, and California have passed such a law, and other of the American States are seriously considering the question. The province of Quebec has adopted a similar policy.

(4) Germany and Hungary oblige all public architectural officials (State or municipal) to have a Government diploma. In France the method of appointing Government officials approaches that of making a diploma necessary. In Italy, Spain, and Russia our profession is a closed one. Surely then the matter is ripe for us and the season opportune, and it is within the realm of practical politics. The longer the matter is left the more growing is the evil and the harder it will be to accomplish.

THE ADVANTAGES OF REGISTRATION.

To put the matter shortly, the advantages arising from registration are these :—

Closing the doors to incompetent men.

Raising the standard of the profession.

Obtaining the confidence of the public and State recognition.

It is not proposed for one moment to say all who desire to build should employ an architect, but what we do propose is that henceforth, in the interests of the public, no person shall be entitled to call himself an architect whose name is not enrolled as qualified under an Act of Parliament, and any person wishing to employ an architect

may, by consulting the official register, ascertain what men are qualified.

SOME ALLEGED OBJECTIONS.

I will not deal with the objections. And I think I may first venture to deal with those raised by the worthy President of the R.I.B.A. (which I have no doubt you have all read), as this is the first time that an opening address has dealt at all exhaustively with the subject of registration. We are told by him that "Protection is in the air," and, without wishing to introduce any political element into our discussion to-night, I agree with him; but for us it is architectural protection. He says "Protection is in the air, I know, and I am not rash enough to express any opinion upon it." I have, however, whether rashly or otherwise, a strong opinion on the subject, and say that we have suffered sufficiently long from free trade in architecture, and it is time we tried a little protection in the way of education and registration. We are told "that an artist is born, not made, no questions and answers admit him into the fold." Now, gentlemen, I ask what fold? What is a fold? It is a place of safety inclosed within a high wall where protection is offered against the wolves that raven. Where is this fold offered to the architectural sheep who seek to come within it for shelter and protection against the architectural wolves? I say it does not yet exist; and if, as some say, it does exist, it only partly surrounds the fold in the way of an Institute examination, which is not compulsory, and is therefore useless for the purpose. What we aim at by our registration is to make the wall complete, and then it will become an architectural fold. Again, referring to the expression, "an artist is born, not made," I want to know who was the author of this catch sentence? I say it is a fallacy. Horace, I think, says, "*Poeta nascitur, non fit*"—a poet is born, not made; but a poet is a very different man to an architect. I won't refute the fallacy myself, but quote to you the words of the President of the Ontario Association of Architects. He says :

Nor is there any real force in the stock objection that architecture is an art, that an architect must be an artist, and an artist cannot be made by examination. . . . But there is much in the way of putting a thing, and I am not afraid to take the highest type of architect as a subject for the examination theory, and affirm that the saying that an artist is born, not made, is only half a truth. That one cannot be made an artist who is not born an artist is true; but it is equally true that one who is born a potential artist must also be made an effective artist. *An artist must be both born and made*, and an examination—which is but a short form of expression for the education which the examinations are instituted to test . . . and even compulsory examination, is the only sure road to make a heaven-gifted artist able to make use of his gifts.

In the President of the Institute's address we are treated to a little parable of the two undergraduates who were trying to induce a tortoise to put his head out of his shell by holding out some tempting bait without result, and an Oxford Don, after watching them for some time, quietly said, "Don't you think, gentlemen, you had better try the other end?" Now I am going to interpret this parable to you—but not in the way the President did. The allusion to the tortoise very aptly typifies the Royal Institute of British Architects in its attitude towards registration. The Don is the President, and we are, in order to draw us off the scent, asked to leave the educational end, that we have been pegging away at so long, and invited to "try the other end"; but we must decline the invitation—firstly, because we are sure we have got hold of the right end to start with, and by a little more perseverance we shall get the Institute to move, and, secondly, the only other end would be to put an end to the examination altogether as a logical sequence to parting with registration. No, gentlemen, this matter is not to be lightly brushed aside by such specious arguments and fallacies as I have endeavoured to expose. Objection has also been urged against the movement that it will create a monopoly, and thus be opposed to the principles of modern legislation; but there cannot be a monopoly created where it is made possible for anyone who proves himself qualified to share the rights. Another objection is that it will be necessary at the outset to register some of the very men who have caused all the mischief. This is very true, and unless this is done it will be found that Parliament will not listen to you. That you must respect vested interests is an axiom of Parliamentary practice, and where a man can show that he has practised architecture, Parliament will say you must not deprive him of his rights, and the obstinate

attempt to exclude this principle from the Medical Act was the chief cause of delaying its passage through Parliament for thirty years. Another conscientious objector is the art architect, and there is, of course, a good deal to be said from his point of view; but I think he looks at the question from his point of view only. He would be quite in favour of registration if all incompetent and inartistic persons could at once be debarred from practising; but if the inartistic and incompetent are still to be tolerated, and even recognised, until time has worked the necessary change, he prefers matters to remain as they are, and to leave the public to discriminate between the good and the bad. But the practice of architecture is a composite one, and includes not only the artistic, but the constructive, hygienic, and scientific, and therein lies its difference from the sister arts, and the need of special training in addition to the artistic spirit. I cannot agree with the purely art architect that you are lowering the dignity of architecture by making it a profession, and that it requires none of your registration. I maintain that at the present time architecture is trailed in the dust at the heels of many men utterly unworthy of the title of architect; but by a scheme of education and registration we shall raise it above its present unsatisfactory surroundings to such a height as will at least bring it to the level of the learned professions; and after this has been attained, then develop and foster the artistic side as much as you will—and the more the better. That you cannot examine a man as to his artistic attainments is partly true. But a painter is no less a painter because he has been instructed in the science of perspective, or in the proper manipulation of his colours and their chemical composition. Or a sculptor is none the worse for a complete course of study of the anatomy of the human figure. We do not, of course, claim that architects can be manufactured from study and examination; but what we do claim is that there is a constructional, hygienic, and scientific side to this question, which is of quite as much importance as the artistic, but which, unlike the arts of painting and sculpture, affects the comfort, health, and well-being of the community, and, this being the case, the men who take upon themselves the responsibility should prove themselves competent. When we dislike a picture or a piece of sculpture it is easily put out of our sight. But it is a much more serious matter with our buildings if, when erected, even with or without artistic merit, they are found unfit by reason of the wrongful disposition of the rooms or fireplaces, or are unsound by reason of faulty construction, bad ventilation, or sanitary defects. Architectural taste is always a changing quantity, so that it is not pretended that it is desirable to examine on the strictly artistic side of architecture, even if you could find examiners who would be agreed on any one point; but the scientific, practical, and constructional side is one to which examination may be applied, as also in the principles upon which architecture is based, and its rise, progress, and development. I will not to-night go into the details of the Registration Bill; suffice it to say that it follows on the lines of the Medical Act. Difficulties to be got over there undoubtedly are; but as the medical profession overcame the difficulties that beset them with regard to the chemists and apothecaries, so also shall we the difficulties with regard to surveyors, engineers, &c., and it is not for us to raise difficulties, but to overcome them as they arise. The first effect of a Registration Act would be to put a stop to any further increase in the number of incompetent practitioners, and thenceforth they would become a diminishing quantity. I appeal to-night to the young men to assist in this matter. It is for them we are fighting this battle; to us who are getting on in life the question will soon have no interest; but we have an abiding interest in our art, and are still willing to assist you in carrying through a great reform which will be to your benefit and that of all good architecture in this country.

SURVEYORS' INSTITUTION.

THE PRESERVATION OF TIMBER.

At the ordinary general meeting of the Surveyors' Institution, held on Monday, a paper on "The Preservation of Timber" was read by Mr. E. T. Scammell, F.R.G.S. The president (Mr. A. Buck) occupied the chair. The author claimed a special importance for his

subject in view of the great and increasing demand for all classes of timber, for which no substitute had yet been found, and of which the consumption in this country alone had more than doubled during the last half-century. In Europe there were only five countries which exported timber, and the amount exported by them all was nearly 2½ millions of tons short of the quantity required by Europe alone. The immense destruction of forests, for legitimate purposes, by waste and by fire, had brought us within measurable distance of a timber famine which might prove disastrous to our commercial and industrial life. Hence the necessity of making the best use of what timber we have. If it were possible to render timber less subject to decay and more durable, and even more fit for industrial use, by means of some method of preservation, no effort should be spared to secure this result; and if timber, now useless for commercial purposes, could be saved from decay, much would be gained. The object of all processes for preserving timber was to prevent or check decay. The causes of decay were, briefly, fungi, bacteria, insects, and worms. The parasitic fungi often rendered trees useless, and they also acted as agents of decay after the tree had been felled. The most important was the *Merulius tachrymanus* which produces dry rot. The spores, germinating on damp wood, particularly where ammonia fumes were present, under the influence of moist air spread in spawn-like threads throughout the wood, forming greyish-white cords and flat cake-like masses of felt on its surface, and on the surfaces of damp soil and brickwork, and thus spread to adjacent timbers. Imperfectly seasoned timber was most susceptible to dry rot, and the fungus could be spread to sound wood even by the saws and clothes of workmen; but timber kept dry was safe, as exposure to really dry air was fatal to the fungus. Previous creosoting of the ends of beams inserted in walls was a protection. Bacteria were also inimical to timber, and recent investigations had proved that probably no change took place in the chemical nature of wood without the active working of some living organism. Among the chief aids to the growth of bacteria and fungi were heat and moisture, without which they could not grow. Excess of cold, of heat, or of moisture (as in the case of timber preserved indefinitely by entire submersion) had a preservative effect. Decay caused by insects and worms was due chiefly to larvae of moths, termites (or white ants), or ship worms or *teredos*. The "death watch" beetle was also responsible for holes in oak timbering and in furniture. The general methods of preservation were by seasoning, natural or artificial, charring or scorching, impregnation. Seasoning rendered wood, when thoroughly dry, practically indestructible. Egyptian wood now existed which was 3,000 years old, and other instances had been found in cave dwellings or buried deep in earth which must be much older. (This wood, as Professor Boulger remarked in the course of the discussion, had not only been thoroughly dried, but had been kept perfectly dry ever since, or, on the other hand, had been continuously under water). If it were possible so to season timber as to reduce it to a skeleton of lignin, there would be little need of other treatment, but the process was a long one. The process might be accelerated by immersion, by which many undesirable constituents were soaked out, and the subsequent drying, if conducted under correct conditions, produced the best and most lasting results, but these were not always uniformly satisfactory, and timber dried by any process calculated to hasten its completion was not always free from defects. The United States Agricultural Department found that properly kiln-dried timber was soon ready and perfectly seasoned. There were two methods, hot-air and steam, of accelerated seasoning. It had been held that steaming reduced the strength of the timber, while too rapid hot-air drying was apt to produce "case-hardening," and at least one high authority affirmed that until the objection to steaming at high temperature was overcome, it was at best a makeshift, and could never replace open-air seasoning, possibly followed by kiln-drying. Processes for accelerated seasoning were, among others, the *Charteris Shapland* system, consisting of placing the timber in a drying-chamber at normal temperature, gradually raising the heat, and encouraging the "sweating" by live steam, and allowing gradual cooling. The *Erith* was a moist-air process, in which warm and very moist air

was constantly circulating around the timber. The *Haskins* was a system by which the general principle of charring was applied to the whole of the wood. The *Parsons* was a drying-kiln system, which the author believed had been in successful operation. The "Sturtevant" was again a kiln system, with a combination of steam-heater and centrifugal fans. The *Superheated Steam* process was a method of steam drying at a very high temperature, for which much was claimed. Charring was an old principle applied to the piles of Venice and, years ago, to the timbers used in our navy. At present it was used for piling and fencing, and sometimes for railway sleepers; but unless the timber had been first well seasoned the process would only hasten its decay, and at best was only temporary in its action. The subject of impregnation or the antiseptic treatment of timber was an important one, the theory being that by it the timber was rendered immune from the attacks of destructive agents, and in some cases its physical properties were improved, and it was rendered less inflammable, if not quite fire-resisting. There were, it had been said, four points to be kept in view. The preparation employed must be poisonous to bacteria and other destroyers, it must be easily applied and permanent, it must penetrate the wood throughout, and it must be cheap. Without saying how far the different processes in vogue fulfilled these conditions, the author proceeded to name the principal ones. The first, in order of date, was *Kyanising*, by means of corrosive sublimate or bichloride of mercury, invented in 1795 and patented in 1832. It had been very popular and successful except in water, especially sea-water. *Sulphate of Copper* had been much used, and was still employed to a limited extent in France for telegraph poles and sleepers. *Burnettising* by chloride of zinc was patented in 1838, and while the chemical used was a powerful antiseptic, it had the disadvantage of being extremely soluble in water. *Creosoting*, so called, by saturation with heavy oils of tar was now used in many ways, and was cheap, lasting, and useful in rendering the wood damp-proof. Besides these methods, there were many others which had recently come into use, among them being *Carbolineum Avenarius*, for which it was claimed that "it penetrates the wood, drives out the moisture, makes it impervious to damp, and protects from rotting, decay, or the action of gases and acids." *Solignum* was a stain and preservative applied either cold or hot, as a preventive against ants and sea worms. *Jodelite* was said to prevent dry rot, damp, and fungus, and the ravages of ants and insects. *Atlas Wood Preserver* consisted of immersion in, or painting with, a solution which was said to prevent destruction by insects, harden the fibre, and strengthen and season the wood. *Stop-rot* was said to be especially serviceable in Tropical climates as being proof against insects. Of true impregnation processes, as distinct from surface or painting methods, the author mentioned several, the first being the *Hasselman* or *Xylosote* process, which consisted in boiling the wood in a solution of the sulphates of copper and iron, with alumina and kanis, by which process the sap was dissolved and carried off, fungi were destroyed, and the iron formed a chemical combination with the cellulose in woody fibre which was insoluble in water. (A subsequent speaker averred that such a chemical combination of iron and cellulose was absolutely impossible.) The *Electric Seasoning* process consisted of the use of solutions of zinc, magnesium, and ammonium sulphate "forced into the wood by electricity." After complete saturation the timber was thoroughly dried, and it was said that green wood, so treated, was improved even more than seasoned wood. The *Non-Inflammable* process aimed, as its name showed, at fire-proofing timber by impregnation with various chemicals. The *Powell* system of wood preservation was the outcome of experiment by its inventor, whose attention was drawn to the fact that timber impregnated with sugar, or used in contact with sugar manufacturing, was never affected by dry rot. It consisted simply of boiling in a thin saccharine solution, and subsequent drying at a fairly high temperature. The result was to increase its strength, durability, elasticity, and cohesiveness, and to improve its appearance. It produced no cracking or splitting, and even reduced cracks in seasoned timber. It lessened the porosity and tendency to warp, split, or expand, and liability to dry rot. One of the chief claims for the process was that low-class woods, such as poplar, could be so improved as to

fit them for many purposes for which high-class woods were now used, and if this were the case it would indeed prove valuable to growers and users of timber in this country.

A discussion followed the reading of the paper, in which part was taken by Mr. T. A. Dickson, who, having to manage land in a hunting country, would be glad, he said, to know of any process by which the life of posts and rails (the posts more especially) could be prolonged; Mr. Harston, who fully recognised the importance of the subject as bearing in many ways on building and fencing; Mr. W. J. Ingram, who said that in his county of Sussex landowners and agents would be glad, in the present impoverished state of agriculture, to be able to use timber for many classes of buildings, where, under the present ridiculous by-laws of the local bodies, it was forbidden; Mr. H. J. Elwes, who wished that it were possible to have some definite statistics of costs and results of the various processes; Mr. A. L. Howard, who, speaking as a practical timber merchant, said he thought one of the greatest causes of decay in building timber was not so much imperfect seasoning, but the using of well-dried timber in damp and unventilated situations; Professor J. E. S. Boulger, who, after explaining the scientific aspect of the process of seasoning, expressed an opinion that, so far as he was able to judge by practical tests, the "Powellising" process was a very promising one; Mr. Gabbett and the President, who briefly commented on the great value of a paper inviting discussion on such a topic.

"COTTAGES NEAR A TOWN."*

THE suggestions made in the little book under this title, by Mr. Barry Parker and Raymond Unwin, on the laying-out and planning of cottages on areas on the outskirts of a town, where garden space must be limited, are well worthy the perusal of land owners and the profession. The authors' scheme is ingenious, though the same idea has been advocated in other forms. Two diagrams are shown: one shows the usual plan of building the cottages on an estate in straight rows of semi-detached houses towards the high roads bounding the land on the south and east, while behind are a number of parallel rows of cottages, with their small yards and out-buildings, and bounded by a railway embankment on the north and west sides. The plan is typical of many new estates, with their dreary backs towards every intermediate road. The authors ask, "Must this be accepted as inevitable, then? Is it a necessity which dictates that cottages should have no better prospect in front than that afforded by the row of houses across the street, or at the back, than that presented by their own and their neighbours' back yards? Is it necessary that half the houses should face up the hill, and that those at the corners of streets, or otherwise more advantageously placed, should have their prospect in most cases bounded by the railway embankment? Above all, is it necessary that half the houses should face north, and have their best rooms sunless?" The authors show by a second diagram that it need not be so; that there is no reason why half the cottages should face north and have sunless living-rooms. In this diagram the cottages are built not in straight rows, but alternately advanced and recessed from each road (in plan like the billet ornament). Not one of the houses has a north aspect, nearly all face south, and the few which do not, face east or west. The arrangement gives to every house three sides open to air space, two of which are sunny sides. Thus along every roadway there is a semi-detached block of cottages followed by two gardens, and then another semi-detached block, and so on, these alternate along the road behind; each pair of cottages being approached by a footpath between the two gardens which front them. A larger scale block-plan shows this arrangement of double cottages and double garden between, and the plans of each pair show that the living-rooms have windows on the three open sides, and so obtain the full benefit of all the available sunshine; the sculleries are also on the sunny side, and the waste-pipes from sink and baths are open to the sun. Two bedrooms in each house have sunny aspects. In this way, on an area of 30 acres, every room is open to sunshine, not one faces exclusively north, and very few face east or west. "The whole have a

southern frontage, with their living-rooms, sculleries, and two bedrooms facing south, and their front doors opening into their living-rooms also on the south side." The plans given are certainly compact, with projecting square bays next entrances, forming porches externally with seats inside, and a large fireplace with seats on each side of living-room range. By small open yards under the main roof, outbuildings are dispensed with, and the equal of the typical back is avoided. Other advantages are secured by the plan illustrated. This mode of arranging the houses in and out does not entail any more space than if they were built in a continuous row, and they occupy less space than the semi-detached blocks. Draughty gaps between the houses are avoided. By this plan all the land available for each house is concentrated in a square compact garden. Each pair of gardens is thus surrounded on three sides by the blocks, the front or footpath side being alone open—in fact, each pair of gardens is bounded at the sides by adjacent cottages on the front row, and behind by the entire frontage of the pair of cottages forming the back row. The gardens thus only require to be fenced off from the road; the space inclosed thus becomes on three sides a walled garden. The external elevations would present a broken line of houses advancing and receding alternately; it would present a change of light and shade of building and garden; each recess or garden would have a fresh interest for the passer-by. Artistically the treatment is an immense improvement on the long, monotonous rows of houses built on one line of frontage. A charm of varied light and shade and gabled arrangement would be the result of this mode of arrangement.

BREAKWATER CONSTRUCTION.

THE Buffalo Breakwater, New York, appears to be a massive structure of its kind, according to an elaborate description given in the November issue of the *Proceedings of the American Society of Civil Engineers*. The design of the work is a radical departure from the previous monolithic structure. Major Symons, the engineer, has adopted "a shell construction, consisting of inner, outer, and cross walls, the internal space being filled with rubble, and the whole covered with a heavy parapet deck of concrete. The walls were founded on large concrete blocks with their bases laid 2 ft. below mean lake level." The whole width of base of highest part of section is 24 ft., the front is battered to a slope of 4 to 1, and the weathered top is 19 ft. wide, the height above mean lake level being about 12 ft. On the harbour side there is a projecting part with sloped deck about 12 ft. wide and 4 ft. high above the lake level. The first concrete block of the breakwater was laid in August, 1899. American Portland cement was used, the brands being the Wayland and the Lehigh. "The block concrete contained 1 part of cement, 2 parts of sand (of which one part was stone crushed sand), 2 parts gravel (1 part granolithic), and two parts of broken stone. The exposed faces of the lake and harbour blocks for a thickness of 3 in. to 6 in. were made of granolithic concrete." The concrete was deposited in the moulds in 6 in. layers, each being tamped before the successive block was put on. On the face blocks a 4 in. piece was left upon face side, while the regular concrete was being dumped, bevelled, and partially tamped. It was then drawn out and the face filled with granolithic concrete. The whole mass was then thoroughly tamped together. The moulds were of 2 in. pine, planed and matched, and the frames of 6 in. and 8 in. timbers held together by iron tie-rods. Various sections and photo. illustrations of the new and old breakwaters are given in the paper, showing the progress and completed state of the concrete superstructure, which are of interest. The paper is by Mr. Emile Low, M.Am.Soc.C.E., to be presented on the 16th of the present month.

FLOODING OF LONDON BASEMENTS.

SIR BENJAMIN BAKER presided, on Wednesday night, over a meeting of the Sanitary Institute held at Parkes Museum, and at which the subject for discussion was "The Floodings of Basements in London by Sewage." The debate was opened by Mr. Maurice Fitzmaurice, C.M.G., the engineer to the London County Council, who said that the question really involved the whole

matter of the drainage of London, and he pointed out that this was in the hands of both the County Council and the borough councils, and that the two sets of drains and sewers were independent. If the County Council sewers were unable to carry away the drainage, the local sewers would be overcharged, but the local sewers might be overcharged and inadequate, leaving the County Council's sewers with little in them. The floodings in basements, of which so much complaint had recently been made, were due in the first place to the exceptional rainfall of the present year, and in the second case to the rapid covering of undeveloped building land, and the consequently increasing strain upon the sewers in the event of exceptional or rapid rainfall. In the case of the first cause, it was impossible to provide against an unusual rainfall such as only happened once in a century; but with regard to the second class of floodings, he pointed out that the County Council by increasing the number of intercepting and outfall sewers, were doing the best to cope with the evil, but that the Council's work would be of no avail if the local authorities did not take care that their sewers, in turn, were capable of dealing with storm waters. He thought, moreover, it should in the future be insisted that all basements in low-lying districts should be made water-tight, and that no drainage should be permitted from them. Mr. Fitzmaurice's address was followed by a paper read by Dr. Kenwood, Medical Officer of Health for Stoke Newington, who, accepting the assurances of Mr. Fitzmaurice that all was being done that the County Council could do, and that it was being done as rapidly as possible, said he would not blame the County Council, as he had originally intended, but he thought a heavy responsibility rested on them for past delays. This question of the prevention of the flooding of basements had been left for other projects which were of much less importance, but which were more showy projects from the advertising point of view. In the highest interests of the public health this subject should have been taken in hand in preference, say, to the housing question, and it would have been much less costly. A discussion followed in which several Metropolitan medical officers of health took part, several of the speakers insisting on the need for forbidding basements altogether in houses built on low-lying parts.

TOWN SUBWAYS.*

By R. M. PARKINSON.

[WITH ILLUSTRATIONS: SEE PP. 794, 811.]

THERE is no doubt that the prevention of the constant opening up of the roadway in our busy streets is becoming one of the most pressing questions of the day. No sooner has a road been widened and repaved at great expense to the community than it is often immediately broken up again for the laying of a new water or gas main, or the repair of an old one, or perhaps for the making of a single house connection. The relief given to the traffic by the widening is often more than nullified by this for a considerable time, and the effect on the finished surface of the roadway is felt for months. Three courses may be taken in dealing with an evil:—It may be remedied, mitigated, or left alone. There are cases where the cure or abatement of the evil would be worse than the evil itself, and as the existing heavy rating of town property is an element in the case it may often be advisable to adopt the last course, especially where the ground is of a treacherous nature, and where large quantities of water may be encountered, and where adjacent buildings may be injured by the necessary excavations. It is, however, impossible to generalise: each case can be treated on its own merits, and in the way the special circumstances applying to it render it best. Owing to the increased and increasing value of property in cities, our buildings have been doubled in height, while the streets have, with only a few exceptions, remained of but one story. Below the surface, however, really making a second story are generally to be found a multitude of water, gas, hydraulic mains, sewers, rain-water drains, telegraph, telephone, and electric lighting wires, tramway rails, and the like running in all directions, and often in unknown positions. Bell and electric lighting wires

* Cottages near a Town. By BARRY PARKER and RAYMOND UNWIN. Longmans, Green, and Co.

* Prize Essay on the Prevention of the Breaking Up of the Streets during the Laying of Water and other Pipes and Conduits, for the Worshipful Company of Paviers.

as well as gas and water pipes in a house placed where they can be got at—not under oak block floors laid on concrete, and at first sight it would appear that the same thing should be done in the street. The problem as to how to do it is a difficult one, and no plan can be recommended as applicable in all instances. The cases that commonly occur may be grouped under three heads:—(1) New, or comparatively new streets with macadamised roadways and paved footways. (2) Paved streets in which tramways are laid. (3) Very old streets where the cellars often extend up to and even beyond the kerb stone. Other cases there are where railways, large mains and sewers are to be found, but these must be dealt with on special lines, for it is impossible to consider every possible combination of circumstances that may occur. Having prepared the parliamentary plans for a number of the London subways, and having had considerable experience in laying water and gas mains and sewers, and having, moreover, superintended the construction of heavy works in London, both as contractor's agent and as resident engineer, the writer feels that his ideas on this matter should be of some value. He proposes first to take the comparatively simple case of a new street, where, owing to the configuration of the ground, the sewer can be laid at an almost constant depth below the surface, in order to be low enough to drain the cellars which are assumed not to project under the footway, and then to consider the necessary modifications that must be made in the plan should the sewer be at a considerable depth. Or should it be necessary to avoid the footway and place the subway in the roadway, either near the surface or deep down or under a tramway, he then intends to take an imaginary old street, and to deal with it at various points, starting with an ideal section and modifying this to meet certain difficulties at various points. However simple or however complicated the system may be, the first thing to be done in treating any case is the preparing of an accurate plan to a scale of perhaps 8ft. to an inch, to show the positions and levels of all the mains and connections and the houses and cellars abutting on the road, as in Fig. 8. The first difficulty that occurs is a legal one. It appears to be the law that in certain, if not all, cases half the street belongs to the frontager, and that the public have only a "right of user"; but, on the other hand, it has been held that where a cellar projects under the roadway, the ground below does not necessarily belong to the owner of the cellar. To settle this question and to authorise the construction of subways everywhere, a general Act of Parliament is required, and some strong clauses should be inserted as to compensation, giving the arbitrator power to take into consideration the probable improvement in property in assessing compensation for the taking of a cellar or part of it as in the case of the Light Railways Act of 1896. This should be fair, and the community should be protected against exorbitant claims and endless litigation. To this end the compensation should be fixed by an official arbitrator, not by a too-generously-minded jury. It is best to avoid touching the cellars; but there are cases where this is impossible, as in Bath and many streets in London. The writer once came across a cellar in the City which projected not only right under the street, but even under a house of different ownership opposite. There should be a provision in the Act for providing new cellar accommodation, perhaps at a lower level, to meet such a case as this: otherwise the amount of compensation, really fairly due, might be enormous. It would perhaps be hardly possible of fair to make the gas and water companies, or the frontagers themselves, pay for any large proportion of the improvement; but a charge should be made, calculated on the estimated saving in the repairs in the case of the companies, while the frontagers ought to pay for access to the subway, the tramway in which could be utilised for the removal of the ashes and other purposes. However constructed, the following requirements must be satisfied in every subway:—(1) Sufficient room must be left round the mains to enable the pipe-jointers to work. This should be 4in. for spigot and socket iron pipes, and 2in. for flanged and stoneware pipes. (2) Sufficient room (10in.) must be left between the mains to enable the pipe-jointers to crawl to the other side, and sufficient head room (3ft.) must be there given them to work in. (3) Sufficient room (21in. by 6ft.) must be left to enable men to walk upright along the subway, although in certain cases this rule may

be modified. (4) Accommodation for bringing in the largest pipes used must be given in the form of a tramway, which ought to run down to a canal or railway. In London every system should, if possible, start from the river, where the material excavated can best be got rid of, and where ballast and cement can be obtained most cheaply. (5) Provision must be made for getting rid of surface water, especially where the soil is water-bearing. (6) Sufficient room must be provided, so far as it is possible to estimate it, for all existing and possible additional mains. Besides the ordinary sewers and large mains, there are often low-level sewers, service mains, and a multitude of other things to be dealt with. The following will give some idea of what may be found in a street: Sewers for surface water, sewage (high and low level) and their connections to the houses, gullies, and ventilators; water mains, large and small, and their connections to the houses, hydrants, and flushing tanks; gas mains, large and small, and their connections to the houses and street lamps; hydraulic mains and their connections; electric lighting and power-feeders to telegraph and telephonic wires and their connections to the houses, tramways, &c.; pneumatic tubes and air tubes in connection with Shone's ejectors; railways and deep subways; cellars, lavatories, and street crossings; tramways and their bonding wires. Eight schemes for dealing with the matter are submitted. These are illustrated by the accompanying drawings, which it is necessary to first describe.

GENERAL DESCRIPTION OF THE VARIOUS PROPOSALS AND DRAWINGS.

Eight schemes are given. Except in Figs. 4 and 7, where the logs can be removed, sufficient room is everywhere given for taking in the largest pipe that can be used on a tram-line, as in requirement No. 4. Except in Figs. 3 and 4, sufficient head room (6ft.) and width (1ft. 9in.), except at the joints, as in Fig. 5) is given for a man to walk upright, to comply with requirement No. 3. A space of 10in. is given between the pipes for a man to crawl through to work on the other side, and as much room as possible is allowed for him there. Fig. 12 leaves something to be desired in this respect; but, under the conditions, this is unavoidable. In certain places the water pipes must be covered either with fine sand, felt, or other composition to keep out the frost; but the temperature in a subway is rarely low enough for this to be necessary. In Fig. 5 the water mains are covered with sand, and in Fig. 4 with silicate cotton. The water from the hydraulic mains is generally wasted, and so cannot be mixed with glycerine; so these pipes require the same protection, if any, as the water pipes. Figs. 1 and 2 are cross and part longitudinal sections respectively, of a subway under the pavement where the sewer is at a reasonable depth, and relate to scheme No. 1. Figs. 3 and 4, scheme No. 2, constitute a cross section of a street where the sewer is not dealt with. Figs. 5 and 6 are sections of a subway under the roadway, the one, scheme No. 3, being near the surface, and the other, scheme No. 4, deep down or in water-bearing strata. Fig. 7, scheme No. 5, deals with a tramway. Fig. 8 is a plan of an imaginary old street; and Figs. 9, 11, and 12, schemes 6, 7, and 8, are cross-sections of this at various places, Fig. 10 being a part longitudinal section of Fig. 9. It is necessary to make the stability of the side walls independent of any support they may get from the earth behind them, as the ground may at any time be excavated for cellars; otherwise an arched roof might be substituted for the girders in Figs. 9 and 10, where sufficient depth could be obtained. More pipes are shown than are ordinarily met with; but they are so shown in order to illustrate the maximum capacity of the subway.

SCHEME NO. 1 (FIGS. 1 AND 2).—DEEP SUBWAY UNDER THE FOOTWAY EMBRACING THE SEWERS.

Fig. 1, cross section; Fig. 2, part longitudinal section. Width, 6ft.; height, 7ft. 6in.; walking space, 1ft. 9in. by 6ft. 3in.; internal diameter of largest possible pipe, 18in. It is assumed that the street has a fair gradient, so that the sewer can be at a nearly constant depth between the surface, and that this must be able to drain cellars 7ft. below the kerb. The sets-back in the side walls are to provide for carrying the centres in the first instance, and the wires and pipes afterwards. The small pipes are carried on straps let into the walls, the large water main on concrete supports 12ft. apart, and the large gas-

main on rolled joists supported by brickwork. Small angle irons are riveted to the rolled joists to take the thrust of the wedges which tighten up the packing blocks provided to hold the pipes secure. A width of 16in. is given between the pipes and the wall to enable the pipe jointer to work. The 4in. pipes on the one side and the supports to the 18in. pipes on the other render a larger gauge than 16in. for the tramline impossible, or 24in. would have been better. Nine-inch glazed pipes are put at intervals in the right-hand wall for the house connections on the other side of the street. As these must, for the reasons given below, be above the top of the sewer, and a rise of at least 6in. must be given in the width of the street, the cellar floor on the right-hand side cannot be much more than 5ft. below the kerb. It is evident from the figure that, so long as plenty of pipes are built into the wall, the making of the connections on the left is a simple matter. It is almost as easy to make them on the right without disturbing the surface. A 4in. steel tube for the soil-pipe and a 3in. tube for the electric mains and the gas and water pipes can be driven across the road in practically the same way as a boring is made for purposes of water supply, a special plant with short tubes and boring tools being provided, together with a powerful hydraulic jack. The stop to the 9in. pipe would first be broken, and then a 6ft. tube and boring tool inserted, the left wall being used as a base to work from, while the traffic on the tramway would be stopped for the time. Access should be provided by iron locked doors placed over the tramway near the supports to the large pipes, which could be utilised as steps. At intervals spaces 13ft. long and 27in. wide should be left in the roof, to admit of the introduction or removal of the pipes, iron girders being used instead of the concrete arch for the purpose, and the flags being laid on these in the same way as they rest on the side walls in Fig. 4. The tramway could be utilised for certain purposes if there were openings to the cellars, and would be very useful in such a street as Paternoster-row, which is always blocked by waggons. If the traffic was likely to be heavy, the working would have to be done by the authority, and by electric traction inwards and outwards, goods being dealt with at different times of the day, and turnouts provided into the cellars, the 4in. water mains being raised or lowered for this purpose. The tramway should lead to some distributing centre within a reasonable distance, where the congestion in the streets is less, and, if possible, also to a railway depot. Properly worked, a narrow-gauge tramway such as this would relieve the streets to a considerable extent, and often render their widening unnecessary. The only cost would be the provision for traction for the tramway itself, and the space it occupies is absolutely essential for the purposes the subway is intended to be constructed for.

SCHEME NO. 2 (FIGS. 3 AND 4).—SHALLOW SUBWAYS UNDER THE FOOTWAYS NOT DEALING WITH THE SEWERS.

Fig. 3, cross-section of main subway; Fig. 4, cross-section of secondary subway. Main subway 6ft. wide, 4ft. 9in. high; secondary subway 2ft. 6in. wide, 2ft. 7in. high; walking space of main subway 1ft. 9in. wide, 4ft. 3in. high; internal diameter of largest possible pipe 15in. The arrangements here explain themselves. The roof is composed of 3in. York flags resting on concrete arches 3ft. apart. Two of these arches would have to be omitted at intervals, and replaced by removable steel joists to enable the 12ft. pipes to be lowered. In addition iron inspecting openings should be put to provide access. The York flags in Fig. 4 should be easily removable, holes being let through them for inserting the T-pieces for lifting them off. When raised the flags should be stood on edge to save space, and act as a fence on the pathway side, and they should be secured by rods fixed in the lifting holes.

SCHEME NO. 3 (FIG. 5).—SUBWAY IN ROADWAY NEAR SURFACE.

Width 7ft.; height 8ft.; walking space 21in. wide, 6ft. 2in. high; internal diameter of largest possible pipe 24in. There is room here for an 18in. gauge tramway over the sewer. Surface water drainage is provided for. The house drainage, &c., are, as before, driven with well tubes. The electric mains are carried on ledges in the channels on either side, iron pins being placed at 3ft. intervals to keep them from falling on to the ledge below. The small pipes are hung up from above, and the straps, being keyed up to a true

line, do not require any adjusting. The smaller water pipes are laid in sand, but the large water main would have to be covered with a non-conducting substance if any danger from frost were to be apprehended.

SCHEME NO. 4 (FIG. 6).—SUBWAY UNDER ROADWAY, DEEP DOWN OR IN WATER-BEARING STRATA.

Diameter in clear 7ft.; walking space 2ft. wide, 6ft. 6in. high; internal diameter of largest possible pipe 21in. This construction is copied from the system in use on the Central London and other similar railways. The large pipes are hung up from the flanges by straps and adjustable bolts, and the smaller ones are supported by straps resting on these as cantilevers. The wires are carried on tiles set in concrete, with which the lower part of the segments is covered; some can also be placed in the channels above the sewers. There are two sewers, the second being provided to enable the tram-line to be laid near the bottom. They could be connected by reducing the headway given for a short distance. In this case the track carrying the pipes would have to be set lower. In the middle plate, each side, holes are left for the house connections. These are nearer the top or bottom of the plate, according to the way they are placed, to enable the tube to be driven in various directions. These holes are covered by plates, which can be removed when it is desired to make a connection. They can then be replaced by plates with stuffing-boxes in water-bearing strata, and the work done under pressure, power for the operation being obtained from the hydraulic or electric mains in the subway and a special air tube. Where water is present, it is better to drive one large tube, in which the 4in. and 3in. tubes can afterwards be placed.

SCHEME NO. 5 (FIG. 7).—SUBWAYS UNDER A DOUBLE-LINE TRAMWAY.

Total width, 12ft 4in.; height, 6ft. 3in.; walking space, 3in. wide by 6ft. high; internal diameter of largest possible pipe, 36in. Here there is room enough for a 24in. tramway, but 36in. pipes would have to be lowered into their position from the top, the largest pipe that could be brought in on the tramway being 27in. in diameter. The sewer is placed right under the subway, which drains into it by gulleys placed at intervals. Should the sewer or house drain require attention they must be reached by means of headings driven in the ordinary way usual in tunnelling. The centre rails of the surface tramway are carried on concrete arches, 10ft. 6in. span, 2ft. rise, 15in. deep by 12in. wide, supported by piers 18in. long by 12in. wide, and so 12ft. centre to centre. The special feature in this scheme is the way the flooring is dealt with. The wood blocks are laid in iron troughs, composed of 3in. buckle plates, stiffened by 3in. by 3in. by 1/2in. Ls., 2ft. apart. The bottom is levelled over with lime concrete, and the blocks are then placed at the right level on sand. These troughs, which are in 6ft. sections, can be taken out bodily when any repairs to the tramway are necessary. They rest through the medium of felt and wood packing on the lower flanges of the rails, which must be 7in. deep, and to these they are firmly fixed by bolts and lock nuts to hold them firmly down. Outside the rails the blocks are secured in angle iron frames held down by bolts. These movable troughs are chiefly wanted at the rail joints, where access to the bonding wires is sometimes necessary. When the saving in headway and consequential excavation is taken into consideration, it will be seen that they are useful in any case on the ground of economy. It will be seen from the section that the rails can be packed from below should they get slack; but in the way they are shown to be laid this would hardly be necessary.

SCHEMES 6, 7, AND 8 (FIGS. 8 TO 12).—SUBWAY IN AN OLD STREET.

Fig. 8 general plan, scale, 8ft. to an inch; Fig. 9 cross section, No. 6 scheme; Fig. 10 part longitudinal section, No. 6 scheme; Fig. 11 part cross section, No. 7 scheme; Fig. 12 part cross section, No. 8 scheme. No. 6 scheme 19ft. wide, 13ft. high; No. 7 scheme 9ft. 6in. wide, 12ft. high; No. 8 scheme 31ft. 6in. wide, 8ft. 10in. high. Internal diameter of largest possible pipe 27in.; width for tramway, 9ft. 6in.; height for tramway, 8ft. 10in.; width of platform (Fig. 12), 11ft.; headway above platform (Fig. 12), 7ft. 3in.

These schemes must be considered together. They are really only parts of one. The black

lines in Fig. 8 show the existing state of things so far as they are known, the red lines the proposals. Between houses 1 and 8 the problem is comparatively simple, but between 8 and 9 a cross street is passed, and under this is a railway which absolutely fixes the level of the subway, and in addition there are the usual cross drains and pipes. The best standard form of construction where there are no special difficulties is illustrated in Figs. 9 and 10. The subway is made large enough to take a double line of tramway, on which cars of the size employed on the City and South London Railway could be run. Sufficient space is allowed at the side for a man to stand against the wall while a car is passing, and the lines are laid a greater distance apart than is required by the Board of Trade for an ordinary tramway. It will be gathered from Fig. 8 that in order to properly deal with all the existing pipes it would be necessary to excavate right across the street to a depth of, perhaps, 6ft. or 8ft., and to fill in again if such a subway as is shown in Fig. 5 was adopted as the type. The material filled in would take some time to settle, and might occasion settlements of the adjacent buildings: so it seems better to put the side walls near the kerbstones, and leave the whole of the underside of the street open. The headway required for a tramcar is not very much greater than is required in any case, and thus it seems better to spend, perhaps, 25 per cent. more money to have a profit-earning concern to pay for part of the expense, and, further, by its means to possibly save a future widening of the street. The type of tramway to be adopted would depend on circumstances. Here provision at the station is only made for cars in pairs, the platform being about 30ft. in length. As before, openings might be made in the cellars for dealing with goods traffic at certain times in the day or night. For very narrow streets the up and down tram lines might be separated, one being taken by one route, and the other by another, the section adopted being as in Fig. 11. The gauge should be from 4in. to 4in. less than the standard 4ft. 8 1/2in., if ordinary grooved tramway rails are used, so that railway waggons can be introduced. With the centre 27in. main the sides of these must not be more than 2ft. high—i.e., than 6ft. above the rail level. By referring to Fig. 8 it will be seen that some of the cellars come beyond the curve, and require special treatment. In the case of No. 4, a small portion must be acquired, and in that of No. 20 a large portion, so much, in fact, as perhaps to cripple the owner's business unless a second cellar at a lower level could be provided in substitution on the order of the official arbitrator. Cellars 6 and 7 can be avoided by curving the line, the cellar wall at 7 being incorporated with the subway wall. At 13 the cellar wall would have to be pulled down and rebuilt, but no compensation should be due for this. As the new wall would be only 14in. thick, it would be necessary to employ a longitudinal girder to support the cross girders. The railway arch in the cross street would have to be removed, and a girder construction adopted. It is assumed that the line is similar to the Metropolitan Railway, on which the minimum structure line is only 13ft. above the rails. If the street level was a foot lower than is shown, the tramway could just be got through by raising the street level a few inches, giving only 3in. clearance above the trams, and using a special construction in carrying the tramway over the railway. If the street was narrower than shown, a single-line tramway would have to be put in, as in Fig. 11. The cross girders shown in Figs. 9 and 10 are steel joists cambered to the curve of the street. They are placed 5ft. apart, centre to centre, and are made strong enough to take a pair of steam rollers moving side by side with a total load of 20 tons on their driving wheels. In Fig. 11 the smaller joists are placed nearer together, as the same depth of concrete cannot be obtained in the jack arches. The house drains would have to be laid in iron siphons in chases in the invert to pass under the electric wire channels and the 21in. main, and they might be flushed by means of valves on the house side and connections with the water main. It would, perhaps, be well to run a secondary sewer at the side under the left rail, and pump to the main sewer by Shone's ejectors at intervals. The water main is carried by concrete supports, 1ft. wide, 12ft. apart; the sewer by concrete supports on the culvert, 6in. wide, 2ft. or 2ft. 6in. apart at the collar, according to the size of the pipes used.

The gas main is suspended from the cross girders by adjustable straps. In Fig. 11 the same construction is given, but 6in. less headway is required. In Fig. 12 a further economy in headroom is gained by the use of trough flooring. The pipes and wires here remain on the left-hand side, but the large pipes have to be placed under the platform, the sewer going under the other half of the platform, which is not here shown. It so happens that it can be put at the right level for doing this, or a siphon would have been necessary. The sewer takes the place of the 27in. main under the right side of the platform, and room is left for another pipe beside it. The pipes rest on 3in. by 3in. (10lb.) rolled joists, and the flooring between is composed of 1/2in. iron plates. Access can be gained by removing part of the platform, which should be fixed with this end in view. A man can get through the 10in. space on either side of the 21in. water main to make the joints. He can do the same between the gas-main and the girder, but at the abutments of the bridge only. He would have to crawl along the narrow space allowed to get to a joint at the centre of the span. The 3ft. culvert must leave its central position at the point R: to join the drain at S, must cross under the tramway in a channel 6ft. wide and 18in. high to allow for the crossing of a future main occupying a position under this line of tramway, similar to that of the 21in. water main under the other. The 15in. sewer is to be laid from R under the platform to the manhole at U, and then to its old position at X. The 27in. gas-main must drop at L to below the platform, and rise again to its old level at V. The 21in. water main has slightly to rise to get under the platform, and has also to leave its central position under the line for this purpose. Access to the subway for both pipes and passengers is given from the street crossing at R by means of steps, in two flights, open to the light. Beyond the platform is placed the underground lavatory, which it is assumed is displaced from its original site by the works. It will be noted that the scale of 8ft. to an inch is by no means too large for showing every detail. In actual work it would perhaps be better to show the new work on tracing paper, only inserting the leading features to localise it.

(To be concluded.)

ROOFS FOR INDUSTRIAL PLANTS.

THE subject of fire-resisting roofs for machine shops and foundries has been taken up by the American Factory Mutual Fire Insurance Companies. It has long been known by those who have made a study of the causes of fire in industrial plants that the roof was the most dangerous feature of a manufacturing building as a rule. A striking example of this was furnished by the destruction of the plant of the Brown Hoisting Machinery Co. The main building belonging to this company was a brick structure with steel roof trusses supported at the ends by steel columns. The floors were of 2in. plank nailed to 4in. by 4in. stringers set in 18in. of cinders. The roof was plank covered with steel. This type of construction will be recognised at once as one which is the favourite of many mill owners, in spite of everything that architects have done to introduce better designs. In this building there was a corrugated iron gasoline tank at one end. Through the carelessness of a workman, fire was started in this tank, which spread with such rapidity that in seven minutes the entire building was in flames and soon afterwards the company's plant was destroyed.

It has been recognised for some time that a substitute was needed for the composition roof. There are, to be sure, says the *Engineering Record*, expensive brick, concrete, and steel roofs which are fireproof, but their cost is too great for them to be used in the majority of mills. There is very little to choose between the pitched roof of boards covered with slate, the mansard roof, and the roof of flat section of boards laid on joists and sheathed underneath. All of them are bad. It is interesting to learn, therefore, that Mr. Alexander Brown, of the Brown Hoisting Machinery Company, has recently brought out a type of construction which has many features of value. This design was prepared for the new plant of his company. Slate laid on light steel supports condenses moisture badly, ordinary corrugated iron is open to a similar objection, roofing tile requires a large number of purlins,

which increases the cost of the structural steel work, and concrete roofs of the usual type are very heavy. Mr. Brown accordingly devised a roof which is 1½ in. thick. Its new feature is a type of corrugated iron called ferroinclave. The corrugations in these sheets bend back on themselves somewhat so that mortar placed over and under the sheets is held by tons of the material, which fit in the corrugations. These sheets are laid much like ordinary corrugated iron roofs. On top of them a mixture of two parts of sand and one part of Portland cement is spread, and on the underside there is used a similar mixture, to which a small amount of lime and hair has been added. The cement is allowed to set for a number of days and then painted until it is water-tight. Such a roof costs about 21d. per square as against 16s. 6d. per square for the ordinary tar and gravel roof. It has been tested in the Insurance Engineering Experiment Station by Professor Charles L. Norton, who finds that it resists fire well, but has a conductivity six to eight times that of a 2 in. spruce plank. This makes the roof more liable to cause a drip than wood, but how far such an objection will extend is considered problematical at present.

A roof of this character deserves careful attention, not only from mill architects but also from the designers of buildings containing a large amount of combustible material, and the structures housing electric plants, where sprinklers cannot be put in, and where the only danger of fire is from the roof materials. In machine shops and foundries it is not at all improbable that the condensation on the inside of the roof would be of little importance, and might well be borne on account of the greater immunity from fire afforded by this system of construction. Few shop superintendents recognise how fully the roof influences the fire hazard of a building. The experience of the Brown Hoising Machinery Company, which lost a large plant of a type often considered fire-proof, should prove the necessity of paying more attention to this feature of design.

TOOL HANDLES.

A CORRESPONDENT of the *Manchester Guardian* points out that the recent advance in price of wooden handles for edged tools, spades, and shovels, which have been seriously felt both in England and America, has been neither artificial nor arbitrary, but is the direct result of a growing scarcity of American wood. The wholesale, and even wanton, destruction of forest trees in America is now making its influence felt. In America the screen door and window screen business has suffered from the practical exhaustion of the white pine forest trees of the north, and recourse has been had to the cypress and the more abundant though less satisfactory yellow pine of the south. Makers of wheelbarrows have been utterly unable to keep up with the business that has come to them, not only because of the enormous demand, but of the great difficulty in getting material. Manufacturers of handles for tools and implements of all kinds have been at their wits' end to know where to get the ash and hickory which alone seem suitable for this purpose. The makers of plumbers' woodwork, too, are feeling the scarcity of the special kinds of woods they have been accustomed to use. In fact, nearly all the manufacturing trades into which wood enters in any form are becoming embarrassed from the lack of sufficient material. It is no wonder that Americans are looking around them with considerable anxiety as to the next district from which to draw their timber supplies. The great forestry reserves of the extreme north-west, particularly Washington and Oregon, are only partly available, because of the freight charges and the lack of suitable lumber. Canada offers relief as far as quantity is concerned, but the tariff is thus far a barrier. The growth of new forest trees is a matter of one or two generations, and only a moderate start has been made in this direction. The facts emphasise the necessity for a broad policy which shall prevent the ruthless destruction of forests and look to the preservation of trees for other reasons besides the material contained in their trunks.

Even in Canada the supplies of the special kinds of timber required are not so extensive as is usually supposed, and, in any event, the Ontario Legislature is imposing an export duty upon Ontario lumber with the object of encouraging the furniture trade in that province. Both American and British manufacturers of goods in which wooden handles or other wood

components play a considerable part must therefore look to some other sources of supply than the old American forests. The British manufacturers have had it suggested to them that they should co-operatively manufacture their own handles by employing British wood workers. The American makers cannot corner the supplies of ash, for the reason that the proportion used would not make it worth while, and, in any event, there are sufficient supplies of suitable timber in Hungary and elsewhere. It has been ascertained that it would be necessary to lay down seven or eight large and costly machines, and no single English firm has a large enough sale for the products to keep such a plant fully employed. One important plant has, however, been laid down in Great Britain for cutting out "D" handles, and experiments are being made with woods other than ash, of which the supplies in Great Britain are by no means enough.

CHIPS.

The general business meeting of the Royal Institute of British Architects to be held on Monday, January 4, will be devoted by the Council to a discussion of the question of compulsory registration for architects.

A resolution has been passed by the committee of representatives acting with the Company of Plumbers, conveying their congratulations to Sir Lees Knowles, M.P., on the baronetcy recently conferred upon him, and recording their high appreciation of the public service rendered by him to the cause of public health by his advocacy in Parliament during the past ten years of the national registration of plumbers, and particularly of his conspicuous services as chairman of the Select Committee appointed in 1892.

Memorial stones were laid of a new chapel being erected by the Bible Christians at Langtree, North Devon, on Thursday in last week. It will cost about £600. Mr. Parsons, of Holsworthy, is the architect, and Mr. Bowden, of Torrington, the contractor.

The ceremony of laying the foundation-stone of the Carnegie Free Library at Levenshulme took place on Saturday afternoon. The new institution is to be built at the end of Cromwell Grove, a growing part of the township. The sum of £2,500 was offered by Mr. Carnegie in response to an appeal.

The London Water Purchase Arbitration Court has reduced the New River Water Company's claim of £13,260,164 to £7,701,617.

A party of Government surveyors commenced on Friday the survey, for building purposes, of the 160 acres of land at Dover to be occupied by the Duke of York's Schools. It is stated the building will be commenced next spring.

At the town-hall, Birkenhead, on Friday, Colonel A. C. Durnford, R.E., conducted two inquiries on behalf of the Local Government Board. The first related to the Birkenhead Corporation's application for sanction to borrow £25,367 for the erection of a depot, stables, &c., in Vittoria-street; and the second concerned proposed sewerage works, in respect of which borrowing powers to the amount of £20,000 were sought.

Preparations are being made at Ports mouth to erect a new chain cable store close to the south railway jetty. The total cost of the work will be £7,800, of which £4,000 will be spent before the end of March.

The estate of the late Mr. Thomas Alexander Pate, architect, of South Shields, and a native of Peterhead, who took an important part in the development of the borough, is entered at £5,936, including net personality £1,637.

Victoria-road U.F. Church, Kirkcaldy, was opened last week. It is of massive proportions, and is in the Renaissance style, constructed of red stone from Dumfries. The church is seated for upwards of 700. There are two halls, which have accommodation for 350 and 180 respectively. The building is lighted with electricity, and cost nearly £7,000.

The department of Egyptian archaeology of the University of Liverpool has completed preliminary arrangements for a season's excavation in Egypt. The necessary firm has been received from the Egyptian Government, and part of the staff is to sail at once for the scene of the work. The fruits of the excavations made last year by Mr. John Garstang, of Liverpool University, at the Necropolis of Ben Hasan, have now found their way into the departmental museum university. The forthcoming expedition will, in addition to carrying on operations at the Necropolis of Ben Hasan, make excavations at the great tomb at Negadeh, which is regarded by French explorers as that of Nenes, the first of all the Kings of Egypt.

Building Intelligence.

BIRMINGHAM.—The Theatre Royal is about to be rebuilt at a cost for erection and equipment of upwards of £50,000. The architect is Mr. Ernest Runtz, of the firm of Runtz and Ford, Walbrook, E.C. The building will be five stories in height, and of red brick or terracotta with stone facings, the elevation to New-street being in a Free treatment of the Renaissance period, surmounted by a group of statuary. The principal entrance—that for the dress circle and stalls—will be at the corner of New-street and Colonnade-passage, while the four front shops with offices above will extend from this point towards Temple-street. The entrance leads into a crush-room, 22ft. by 19ft., from which a staircase on the right will afford access to the dress circle, and another on the left will descend to the stalls. The box office is placed on the right of the crush-room. The stalls and dress circle have a wide corridor at the back, in which are arranged retiring-rooms, and from which are the stairs to the lower exits. The area of the house is divided into stalls, pit stalls, and pit, with two exits from the former, and three from the latter. There are also two large refreshment rooms. Behind the dress circle is a foyer, in which a special feature will be a raised alcove. The position of the auditorium has been changed. In the old theatre the audience sat with their backs to Temple-street, and faced the stage, which was on the Colonnade-passage side; but in the new building the stage will be on the Stephenson-street side, and the audience will sit with their backs to New-street. The seating accommodation is for 2,260 persons, and is apportioned as follows:—Stalls 230, pit stalls and pit 520, dress circle 350, upper circle 440, boxes 48, and gallery 672. Provision is made for twelve private boxes. The proscenium opening is 34ft., and the stage itself is 73ft. wide, with a total depth of 48ft. In the old theatre the stage was the largest in the country, with the exception of the one at Drury-lane; but the new stage will not be so big. The dressing-room accommodation is protected by fire-resisting staircases to the street. The house is to be lighted by electricity, and heated and ventilated on the Plenum system. The proscenium will be fitted with a fire-resisting curtain, and there will be an installation of hydrants on the various floors, both behind the curtain and in the auditorium. The whole of the staircases will be fireproof construction, with hand-rails, and inclosed on all sides by brickwork walls.

BIRMINGHAM UNIVERSITY.—Within a few weeks building operations in connection with the erection of the second and more important section of the Birmingham University new buildings will be entered upon, and within a period of nine months, according to the terms of the contract, one portion of the main structure is to be completed. Messrs. Smith and Pitts, of Balsall Heath, the builders who secured the contract for the erection of the power station, have practically completed this work, and the more extensive work of putting in the foundations, which was let to Mr. Thomas Rowbotham, contractor, Small Heath, will very shortly be finished. The cost of these foundations will be something like £70,000. The work includes the construction of the basements, kitchens, and subways, these rising to a height of 13ft. 6in., and the superstructures thereon rise to a further height of 18ft. 6in. In fact, at the present time a considerable portion of the building is nearly half completed. The work has been in hand about fifteen months, and for a long time some 500 operatives were employed daily. To accelerate the job the contractor has now upon the ground up-to-date machine plant. The tenders for the further superstructures, internal finishings, and other work will shortly be dealt with by the architects, Messrs. Aston Webb, R.A., and E. Ingress Bell.

CHELTEMHAM.—When the assembly-rooms at Cheltenham, which were opened in the year of Waterloo by the Duke of Wellington, gave place, four years ago, to new banking premises, the demand which had long been felt for a rendezvous for the many social functions and public gatherings characteristic of the life of a progressive pleasure resort became a matter of urgency. The town council, laying aside more ambitious schemes for the conversion of the winter garden—an immense glass structure ill-adapted to the demands necessarily made upon its use—into a

modern kursaal or for the combination of assembly rooms with new municipal offices, turned its attention to the immediate provision of a building that should answer in every respect to the social requirements of the town. The result has been the erection, to the plans of Mr. F. W. Waller, of Gloucester, of a hall of Classic Renaissance character, grouped around which is a suite of rooms with every accommodation for service. The hall, which was opened on Saturday by Sir M. Hicks-Beach, will give accommodation to an audience estimated at 2,500, and the floor has been specially constructed on girders and spiral springs for dancing. There are also large drawing and supper rooms, with refreshment, smoking, and cardrooms. The total cost has been £50,000. Messrs. Collins and Godfrey, of Cheltenham and Tewkesbury, were the contractors.

CHICHESTER CATHEDRAL.—The committee appointed to consider the best form of memorial to Archbishop Mount have decided to recommend the re-erection of a screen in Chichester Cathedral. Early in the 16th century a screen of carved oak, rich with gilding and colouring, was erected in Chichester Cathedral behind the high altar, so as to separate the choir from the retro-choir, or presbytery. The lower part was solid, with a door on each side of the altar, but the upper part was probably of open work, so as to allow a view from the choir of the triforium above the entrance to the Lady-chapel. At some subsequent period, however, pieces of thin wood were nailed over the upper part of the eastern side of the screen, which hid the carving, as far as the upper part of it was concerned, from a spectator standing in the retro-choir. About 1759 much of the portion of the screen immediately above the altar was cut away, and an arched panel filled with crimson velvet was substituted, having in the centre the monogram "I.H.S.," surmounted by a circle of rays, all worked in gold thread. In 1886, therefore, the late Canon Swainson proposed the removal of the screen altogether, and the erection in its place of a stone and marble reredos to the altar. This reredos was to have consisted of three portions, each crowned by a gable; the central and highest portion immediately behind the altar, and those right and left of it extending to the walls of the choir. The ancient screen was removed, and its fragments stowed away in various parts of the cathedral, and the central portion of the new reredos was erected. But no sooner was it placed in position than it was recognised that it was out of harmony with the architecture of the church, and also blocked out the view of the triforium of the retro-choir even more completely than the old screen. Canon Swainson, therefore, made no further effort to complete the design, and the two side portions were never added, their places being filled by curtains. Some of the woodwork of the old screen has disappeared, but enough remains to allow of its complete reconstruction as it was originally erected, excepting the central portion, which was cut away in 1759.

GLASGOW.—The Moss's Empires, Ltd., have acquired a site and have instructed their architect, Mr. Frank Matcham, of London, to prepare plans for a new theatre of varieties in the south side of Glasgow. The building will have extensive frontages to Eglinton, Herbertson, and South Coburg-streets, the main front being to Eglinton-street. The building will have accommodation provided for some 3,000 to 4,000 people. The auditorium will be 90ft. square, and will contain stalls, pit, circle, and a large gallery. The circles will be constructed on the architect's patented, curvilinear, cantileverage construction, no columns being used. Waiting-rooms will be provided for each separate part of the house. The interior decorations will be executed in fibrous plaster, and the hangings will be in silk plush. The stalls and circle will be fitted with tip-up chairs. The building will be constructed of fireproof materials and illuminated by electric light. The Moss's Empires are also entirely redecorating, refurnishing, and making additions to the Glasgow Empire, and the work, which is being carried out under the direction of their architect, Mr. Frank Matcham, will be completed by Christmas.

LONDON COUNTY COUNCIL.—At Tuesday's weekly meeting, an estimate of £61,000 for the acquisition of a site for an electricity generating station in Pimlico and of a site for the housing of displaced working-class residents was approved. On the recommendation of the Housing of the Working Classes Committee the tender for

£18,861 of the Haslemere Builders, Limited, was accepted for the erection of Wenlake-buildings, Roby-street, St. Luke, in connection with the Garden-row, St. Luke, Improvement Scheme, 1899. Replying to a question, Mr. Robinson (chairman of the Establishment Committee) said that the Sites Committee did not think the present a prudent time for bringing forward any large scheme for housing the Council's staff. The Government was desirous of knowing the views of the Council at an early date as to the vacant land opposite the county-hall, but they would not take any action without giving the Council the opportunity of considering the matter further. The question of purchasing tramway rails in Belgium gave rise to a long discussion. Lieut.-Colonel Rotton moved that the Highways Committee ascertain the hours and rate of pay of the Belgian workmen engaged on the Council's rails, and whether there was Sunday work. To this an amendment was proposed, extending the inquiry to all foreign workmen engaged on rails for the Government and provincial corporations, as well as for the Council. This was carried.

LEITH.—Some eight months ago the New Gaiety Theatre, Leith, was closed, the property having been acquired by the Grand Theatre and Opera House, Glasgow (Limited). At the same time other premises in the Kirkgate, and adjoining the old theatre, were purchased, and since then a scheme of construction has been carried out, so that the buildings have been entirely metamorphosed. The accommodation has been more than doubled by gutting the interior, heightening the roof, and erecting two galleries. New furnishings have been introduced, the stage has been enlarged, and the entrances increased. Altogether, there is now seating accommodation for 2,000 persons—in the pit, pit stalls, and orchestra stalls, 900; in the dress circle, 300; and in the gallery, 800. There are also three tiers of boxes on either side of the proscenium. In the centre of the proscenium there is a painted subject, symbolic of the drama and poetry, above the names of Shakespeare, Burns, and Scott. The proscenium front to boxes and the main ceiling are constructed in ornamental fibrous plaster work. On each of the floors there are bar-rooms and smoking-rooms, and, in addition, at the dress circle there are ladies' rooms. The galleries, built on the cantilever principle, are constructed entirely of steel and concrete, and, along with the staircases, are fireproof. A special staircase runs right up to the gallery, to be used only in cases of panic. The whole building is lighted by electricity. The plans were prepared by Baillie Davidson, architect and measurer, Coatbridge, under whose personal superintendence the work has been carried out. The new theatre, which was opened on Monday, has cost, including site, reconstruction, and furnishings, £25,000.

MAIDSTONE.—On Wednesday week the Archbishop of Canterbury visited St. Michael's Church, and dedicated the apse which has been presented to the church by the Arkcoll family in memory of the late Miss Arkcoll. The memorial forms a side chapel, built into the north transept. The work has been carried out by Messrs. R. Corben and Co., in accordance with a design by Sir Charles Nicholson, Bart., of the firm of Messrs. Nicholson and Corlette. The material used is ragstone, faced with Corsham stone, with panels of flint. The interior stonework is chalk from the Boxley Hills. This is the first time in the memory of the oldest Maidstone stonemason that chalk has been used for this kind of work. The scheme has included the reflooring of that portion of the church, marble being used. There is accommodation in the apse for 36 people. The reredos and altar screen are of carved wood, and it is lit by the two stained-glass windows which were formerly in the part of the old wall which had to be cut away.

MANCHESTER.—The new head offices of Parr's Bank, situate in Spring-gardens and York-street, Manchester, were opened for the first time on Saturday morning last. The exterior of the building, which is designed in Victorian Renaissance style, is of red Carlisle stone, the roof being of green slates and the dome surmounting the tower of copper. The bank occupies the whole of the ground floor and basement. The latter floor is practically in two portions, one portion being given up to the various strong-rooms, the other half to the various rooms usually assigned to the clerking staff of a large bank. The ground floor is handsomely decorated, the whole of the interior being lined with marble,

and all the woodwork being of dark stained mahogany. A feature of the banking chamber is the saloon roof over the clerks' portion. This roof is treated with enriched fibrous plaster work and leaded glazing. The large windows of the bank are framed in bronze. The whole of the upper floors, three in number, are divided up into offices for letting. The contractors for the building are Messrs. Neill and Sons, Manchester, and the architects Messrs. Charles Heathcote and Sons, also of Manchester.

OXFORD.—On St. Andrew's Day the parish church was reopened, after having been restored at the sole cost of Mr. H. J. Allcroft, of Stokesay Court. The chancel is of 13th-century date, and the nave, including chancel arch, is of the 12th century. None of the original windows exist. Each side of the 15th-century tower was recently found to be cracked the full height of the wall from the ground upwards in several places. The solid portions of the walls at the sides of the cracks have now been bonded together with long stones from the inside face, and strengthened. The beams supporting bells and the roof of the tower have been renewed in parts, and strengthened with iron straps and bolts. The lead gutters to the roof have been recast and laid to proper falls, and the roof itself covered with slates, in place of the former zinc sheets. The bell frame has been braced with timbers down to the first-floor level. The walls of the nave and chancel have been repaired, the foundations underpinned, and the exterior surface repointed; and the roofs have been made weather-proof. A concrete channel has been formed around the outside of the walls at ground level, faced with stone, laid to falls. Inside the church the floor has been taken up and the soil excavated, and a bed of concrete spread over the surface, under new oak floors and seats, and stone and brick paving in the passages. The deal pews have been replaced by English oak seats, with the exception of the 17th-century oak pews, which have been repaired and fitted up again at the west end. The 16th-century pulpit has been repaired. New English oak seats and fittings have been put in the chancel in the place of the modern deal ones. The interior surfaces of the walls have been repaired and treated with colour-wash. The work has been carried out under the auspices of the Society for the Protection of Ancient Buildings, London, and under the personal supervision of Mr. William Weir, architect.

A Local Government Board inquiry has been held at Wakefield into an application of the city council to borrow £2,250 for the purchase of a site at Alverthorpe for an infectious diseases hospital.

The town council of Durban, Natal, adopted, on Tuesday, plans for a new town-hall to cost £300,000.

The Mayor of Westminster, Mr. T. Walter L. Emden, past President of the Society of Architects, is to be appointed to represent that city on the London Water Board, in the place of Colonel Probyn, resigned.

Mr. Robert William Hammond, late chief surveyor to the War Department, died on Sunday at his residence, 73, Lee-road, Blackheath, of pneumonia, aged 72 years.

In the case of the application made on behalf of William Purkis, Braintree, Essex, builder, the order of discharge from bankruptcy has been granted, but is suspended for two years ending Nov. 11, 1905.

In the Court of Appeal, on Tuesday, Lord Justices Vaughan Williams, Romer, and Stirling gave judgment in an appeal of the South Metropolitan Gas Company against a judgment of Mr. Justice Joyce upholding a claim by the London County Council of the right of its examiners to test the appellants' gas on Sundays. Their lordships dismissed the appeal with costs, and affirmed the finding of the Court below.

At the town-hall, Gravesend, on Wednesday week, a Board of Trade inquiry was held into the circumstances of the explosion of a pipe which occurred at the works of the Tower Group Cement Manufacturers in August, and which resulted in the death of two men. Mr. Howard Smith, barrister-at-law, and Mr. G. Fullerton Bell, engineer, sat as commissioners. The commissioners decided that no blame was attached to the firm or to the employés, and that the men themselves had not taken proper care, and had filled the pipe with steam in too great a hurry. The explosion was caused by water-hammer action.

The new schools, Ipswich, are being warmed and ventilated by means of Shorland's patent Manchester grates, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

NATIONAL SILVER MEDAL DESIGN FOR A REREDOS.—A COTTAGE IN WARWICKSHIRE.—ORGAN CASE, ST. BRELADE'S, JERSEY.—THE MANSION HOUSE, ROSEHAUGH, N.B.—IMPERIAL COURT, ALBERT GATE.—ROYAL INSURANCE OFFICES, SHREWSBURY.—TOWN SUBWAYS.

Our Illustrations.

NATIONAL SILVER MEDAL DESIGN FOR A REREDOS.

The explanatory notes on the drawing give several particulars. There is a note which specifies the materials of the reredos, and baldachin, which is intended to be of oak, painted and gilded. The lower stage on which it rests, also the altar, and shelf are shown in marble. The cresting of the projecting canopy is supported by corbels in the form of kneeling angels, which are supposed to be suggesting the prayer "Save, Lord, and hear us, O King of Heaven," which is on the scroll. On the side wings is the Sanctus, and the figures are intended for the Company of Heaven. These would be in gesso and very low relief, and coloured. The centre panel is a painting of the Crucifixion, executed in dull red colours, and on either side are the Blessed Virgin and St. John. The small figures in the niches represent the Early British Saints, to whom the English Church owes so much—SS. Aidan, Finan, Chad, Bede, Swithin, &c. Mr. J. Harold Gibson, A.R.I.B.A., of Manchester, is the author of this interesting scheme, for which a national silver medal was awarded this year.

COTTAGE IN WARWICKSHIRE.

The drawing explains itself. In planning this house a large living-room and a large bedroom were considered essential. The bathroom was made larger than usual, in order that it might serve as an emergency bedroom. The materials proposed to be used are sand-faced bricks, with white cement stucco above, and strawberry red tiles for the roofs. Mr. C. Pitwood Carter is the architect.

ORGAN CASE, ST. BRELADE'S CHURCH, JERSEY.

The position of the organ was a very difficult question, the chancel aisle being too interesting and beautiful a feature to block up. It was eventually decided to place it in the south transept, where originally was a gallery set apart for the police, a body which in Jersey is elected by each parish, and is unpaid, but to belong to which is held to be an honour, if not a pleasure. The space under the organ-chamber is used as a vestry (the double doors leading to it being shown on the drawing). The organist sits and plays in the small recess on the left, which adjoins the chancel screen, and whence, by means of a looking-glass, he can command the choir. The architects are Messrs. Rogers, Bone, and Coles, of Carteret-street, S.W.

ROSEHAUGH.

The building of which these sketches represent various portions has been recently completed, the whole of the general contract being carried out by Messrs. Foster and Dicksee, of Rugby. The building is built of stone from local quarries, the dressings and all architectural

features being in grey sandstone from a quarry on the site, and the general walling of red sandstone from a quarry in the neighbourhood. Internally, the various rooms have been finished in distinctive styles, of which we illustrate two of the bedrooms, one in the Jacobean style, and the other in the Elizabethan style, the fireplace shown in illustration having originally belonged to the old palace of James I., Bromley, Kent. Throughout the house many fine examples of antique chimneypieces, doorways, tapestries, and other works of art have been fitted up. In fact the house is largely a museum of antiquities. The architect was Mr. Wm. Flockhart, F.R.I.B.A., New Bond-street, London, W.

IMPERIAL COURT, BROMPTON ROAD, W.

THIS building, in course of erection close to Sloane-street, has frontages to Brompton-road and Basil-street. Business premises will occupy the ground floor, with entresol and basement, and a glass-covered arcade connecting Basil-street and Brompton-road will contain shops of this description. The whole of the upper part will consist of residential suites, four on each floor. Each flat contains from eight to ten rooms, with large halls, the principal rooms being lighted from either of the thoroughfares mentioned, whilst the other rooms obtain a good light from a large central courtyard. By the means of a transverse corridor the whole is served with one lift and one staircase, thus reducing an item of some importance in the cost of the administration. The treatment of the reception-rooms and halls will consist of enamelled wood panelling, partly filled in with silk, and modelled ceilings, the whole after the manner of the Late 18th-century period. The servants' quarters are cut completely off and self-contained, with ample accommodation, including a bathroom. In the external treatment effect is sought by the retention of undisturbed surface consistent with practical fenestration. The materials employed are stone and red brick, of good colour, and the roofs will be covered with Westmoreland slates. The whole of the building will be rendered as fire-resisting as possible, the materials forming the floors, flats, and roofs being steel and concrete; should fire occur, a thorough system of escape connects with all rooms. At the west end of the block is situated the Sloane-street Station of the Great Northern and Piccadilly Railway, occupying a width of about 45ft., running through to Basil-street, and up to the level of the first floor glazed faience will be freely used externally and internally for this portion, above which flats will ultimately be erected. The contractors for Imperial Court are Messrs. Perry and Co., of Bow, and those for the station portion Messrs. John Allen and Sons, of Kilburn. The total cost of the work when completed will be about £180,000. The whole is being carried out from the designs and under the direction of the architect, Mr. G. D. Martin, F.S.I., of Pall Mall East, S.W.

ROYAL INSURANCE OFFICES, SHREWSBURY.

THIS is a branch office for the Royal Insurance Co., Ltd., now being erected on an important site at the top of Mardol Head, Shrewsbury. The peculiar formation and limited area of the site formed a problem as to how the accommodation required was to be provided. The front is constructed of steel framework with Portland stone frontages, having polished Aberdeen granite lower story. The floors are of steel and concrete, finished with oak block flooring. The accommodation consists of a general office with a mezzanine floor over a portion of same, providing room altogether for twelve clerks, a typist's room, board room, and manager's room; the top floor being devoted to caretaker's residence. Strong room, stationery room, and other accommodation is provided in the basement. A lift for general purposes runs from the basement to top story. The interior will be finished with oak wall panelling and mahogany fittings. The heating is by means of radiators on the low-pressure system. The contractors are Messrs. R. Price and Sons, Shrewsbury. Mr. A. E. Lloyd Oswell, A.R.I.B.A., is the architect.

TOWN SUBWAYS.

(SEE prize essay by R. M. Parkinson, on page 788).

The Board of Trade is about to be asked to grant a provisional order for incorporation of a company to construct a pier and other works at Broadstairs, between Victoria Gardens and the Grand Hotel, upon the roadway known as Louisa Gap, extending seaward for distance of about 1,300ft.

STAINED GLASS.

MOFFAT.—The other afternoon, in the new chapel recently erected in connection with St. Ninians College, Moffat, the unveiling and dedicating took place of a stained-glass window in memory of ten former pupils of the school who fell in the South African Campaign. The window is a three-light one, executed by Mr. C. E. Kemp, London. The central light represents the Crucifixion, in which the victory of Christ over Death is emphasised, while the same idea of victory is carried out in the lesser lights, one of which depicts the victory of St. Michael over the Spiritual Dragon, the other portraying that of St. George of England over the Earthly Dragon. The window is suitably inscribed in Latin.

CHIPS.

A Roman Catholic church is being built in Lyons-crescent, Tonbridge, from plans by Mr. W. R. Hughes, of Tunbridge Wells and Craven-street, W.C.

The Eton College trustees have granted to a syndicate an option of purchase of 243 acres of their land lying to the north-west of Wyldes Farm, for the purpose of establishing a "garden suburb" for the industrial classes.

The tender of Mr. Herbert Holloway, of Wolverhampton, amounting to £11,970, has been accepted for carrying out the sewerage scheme for Penn and Pennfields, near Wolverhampton.

With the object of obtaining further powers as to police and public health, the corporation of Glasgow are promoting a Provisional Order. One of the objects of the order is to authorise the corporation to borrow an additional sum, not exceeding £250,000, to be applied for purposes of the Police Acts, including the cost of new police buildings, fire stations, halls, public baths, and washhouses.

The crematorium which is to be erected by the Bradford Corporation in Scholemoor Cemetery will cost about £5,000. The structure has been designed by Mr. F. E. P. Edwards, A.R.I.B.A., with a free treatment of English Gothic, to harmonise with the other buildings in the cemetery. It consists of a mortuary chapel, 30ft. by 24ft., with a separate chamber containing the furnace. The hall will have a hammer-beam open-timbered roof, and will be approached through an arcaded porch. In the centre of the wall opposite the principal entrance is the catafalque.

A new scheme is under consideration by the town council of Blackpool in connection with the widening of the promenade between the North and Central Piers. It is estimated that the work will cost £144,000. It is proposed that from a point opposite the Tower to the north pier the promenade shall be in two terraces similar to the promenades at North Shore. The upper terrace will be 51ft. wide, and the lower one, which will run further westward, 30ft.

The work of restoring the well-known Guild Chapel at Stratford-on-Avon is now being proceeded with, under the supervision of Mr. J. A. Cossins, of Birmingham. Mrs. Flower, of Avonbank, has given a generous sum to defray the cost.

The new American church in Berlin was dedicated on Thursday in last week. The church, which has been built at a cost of £20,000, will accommodate about 400 people.

A joint committee of the Liverpool Estate and Housing Committees has been appointed to consider a scheme for fulfilling the housing obligations of the corporation under the various Improvement Acts and Orders.

A Volunteer Artillery drill-hall is about to be built in the Main-road, Dovercourt, at an estimated cost of £3,000. The chief apartments will measure 73ft. by 56ft., and adjoining will be a canteen 31ft. by 27ft., a billiard-room, armoury, offices, and stores.

The bell-founders are now busily at work upon the restoration of the bells of St. Mary Magdalen's Church, Pulham Market. Messrs. Warner's, Crippllegate, London, are carrying out the work, which consists of the addition of two new trebles to the present peal of six, the tuning of the old bells, and the construction of a new steel frame in place of the old wood frame.

The Bishop of Durham has dedicated two stained-glass windows in Christ Church, Hamsterley, Durham, to the memory of the late Viscount Gort, the east window having been erected by Viscountess Gort, and the west window by public subscription. Mr. G. J. Biguley, of Newcastle on Tyne, is the artist. The east window represents Our Lord's Ascension, and the west window St. John the Evangelist and St. John the Baptist.

Birmingham Corporation have under consideration a scheme for deepening and lining with brickwork a portion of the bed of the River Lea at Saltley, to prevent floods, at a cost of £30,000.

OBITUARY.

The death of Mr. WILLIAM FREDERICK HEMSOLL, architect, took place at his residence, 40, Southbourne-road, Sheffield, on Saturday. He had been an invalid for several years, and unable to attend business since March last. Mr. Hemsoll was a Sheffield man, son of the late Mr. George Hemsoll. He was apprenticed to the profession of architect, surveyor, and valuer, and started on his own account in Figtreet-lane when quite a young man. He was for ten years in partnership with Mr. Joseph Smith, and with him designed and superintended the erection of the Reform Club, several chapels, and other buildings, and afterwards was associated with Mr. H. L. Paterson in the erection of the Woodfinn Convalescent Home and several council schools. His partnership with Mr. Paterson was dissolved twelve months ago, when Mr. F. W. Chapman joined him. He was a Congregationalist, and connected with Mount Zion Church nearly all his life. For twenty-seven years he held the office of deacon and secretary. His death will be regretted by his fellow-members of the Sheffield Society of Architects and Surveyors, and by many other friends. He was fifty-seven years of age, and leaves a widow and three daughters.

Mr. CHARES FOWLER, architect, late of the Portland Estate Office, London, and of 5, Marlborough-place, St. John's Wood, died on Tuesday last at Abbotsleigh, Farnborough, Hants, aged eighty years. He joined the Royal Institute of British Architects as an Associate in 1851, and became a Life Member and Fellow in 1862. He retired to Farnborough about a year ago.

Four stained-glass windows in the sanctuary of St. Mary's Roman Catholic Church, Coventry, in memory of the late Mr. Edward Petre, of Whitley Abbey, were unveiled last week. The windows are the work of Mr. Frank Holt, of Messrs. Holt and Co., stained-glass artists, Warwick. They represent: (1) The Visitation, (2) the Nativity of Our Lord, (3) the Presentation of Our Lord in the Temple, and (4) the Finding of Our Lord in the Temple.

A new organ, built by Messrs. Brindley and Foster, was opened in the Wesleyan Chapel, Thornhill, Leeds, on Saturday.

The Mid-Cheshire Joint Isolation Hospital authority—the first to be constituted in Cheshire—adopted on Friday plans for submission to the county council and the Local Government Board of a joint hospital for the Northwich, Winsford, and Middlewich urban districts and the Northwich rural district. The estimated cost, including site, but exclusive of furnishing and outfall works, is £13,537.

On Friday a memorial window, which has been placed in the east end of Burton parish church, Salop, by the widow of Mr. William Congreve, formerly of Burton Hall, was dedicated by Archdeacon Barber. The centre of the window is the Crucifixion, and on the right and left are St. George and St. Nicholas, the latter being the patron saint of the church.

At Cambridge University on Saturday, the degree of Doctor in Letters was conferred on M. Théophile Homolle, member of the Institute of France and Director of the French School at Athens, who lectured three weeks since at the Royal Institute of British Architects on his recent discoveries at the Temple of Cnidus in Delphi.

At a meeting of the West Hartlepool Town Council held on the 4th inst., Mr. Nelson F. Dennis, engineer and surveyor to the urban district council of Aldershot, was appointed borough engineer and surveyor in succession to Mr. J. W. Brown, M.Inst.C.E., who resigned some two months ago, and will retire from the office at the end of the year. Mr. Brown, who has been nearly 20 years borough engineer of West Hartlepool, has decided to take up private practice as a general consulting civil engineer, and has taken offices in Church-square, West Hartlepool.

The historic Pyx Chapel, adjoining the Chapter House of Westminster Abbey, is about to be lighted by electricity and thrown open for the inspection of the public. The chapel, now under the control of the Office of Works, was at one time the depository of the Regalia of the Scottish Kings. It was here that the famous robbery of £100,000, collected for the Scotch wars by Edward I., took place. Since then access to the apartment, with its double doors of oak, was only possible by the aid of seven keys, which were in the possession of as many distinct officials of the Exchequer. Among the other contents of the chapel are a stone altar, and some ancient chests in which State documents, Exchequer tallies, and standards were formerly stored.

PROFESSIONAL AND TRADE SOCIETIES.

LAIRDS' LOFTS IN SCOTTISH CHURCHES.—Under the auspices of the Edinburgh district of the Ecclesiological Society of Scotland a lecture was delivered by Professor Cooper, of Glasgow, in the hall of the Edinburgh Architectural Association, 117, George-street, Edinburgh, last week. Sir James Balfour Paul, Lyon King of Arms, presided. Professor Cooper took for his subject "Lairds' Lofts in Parish Churches," and illustrated it principally from the churches of the middle Borders. Professor Cooper said that their nobility and gentry (though they themselves in many cases seemed to have forgotten it) were mainly responsible for that form of church government which the Glasgow Assembly of 1638 made the symbol of the nation's liberty, and for the type of parish kirk which was well-nigh universal throughout the country from the days of Andrew Melville to the days of Dr. Chalmers. The Act of Revocation was the real source of the Great Rebellion. But while they gave the least they could for the glory of God, they were by no means prepared to forego either in the kirk or out of it, the honour which they considered to be due to their own temporal place and dignity. The lairds' lofts were a striking instance of this. These lofts had their historical value as witnesses of the relations which, throughout the greater part of two eventful centuries, subsisted between the lairds and the church. They had also in many cases no small artistic merit, and in the severe exclusion of other ornaments they were often the only decoration of the churches where they were found. Many of these lofts were erected at the east end of the church in the chancel, immediately over the place where in pre-Reformation times the altar stood. The reason of this was that in the general spoliation of church property the rectorial tithes passed into the hands of the proprietor, and with them went naturally the chancels of the churches, which it had always been the duty of the rector to maintain.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.—Mr. Edwin C. Wallis, A.I.E.E., Vice-President of the National Association of Electrical Contractors, read a paper on Friday night before the members of the Leeds and Yorkshire Architectural Society. His subject was "Electrical Work as Affecting Architects." He called attention to the numerous electrical appliances which now constitute an inherent part of modern buildings, and urged the importance of the work being thoroughly executed. Lightning-conductors, he said, ought not to be neglected, for if badly earthed or discontinuous they became fraught with danger. No need existed for the hideous obstructiveness at the tops of some conductors, but there was reason for blending them with the metal finial. Electrical hoists were coming more and more into use; they were marked either with continuous current, single-phase current, or two-phase current, and were quite manageable. In some respects they were superior to hydraulic hoists. The cost of working was less wherever electricity could be obtained at a low figure. Speaking of electrical development, Mr. Wallis recalled the fact that twenty years ago there was very little electric lighting in Leeds. The corporation power station in Whitehall-road began with 500 H.P.; but now there was an installation of 14,000 H.P., and another 4,000 H.P. was on order. Great advance had been made in electrical work and accessories, and the improvement was still going on. The tendency was to use higher pressures; where formerly 50 volts were used in lighting, 230 volts were now used. A paper dealing with metal casements was afterwards read by Mr. G. Farrar. Mr. Butler Wilson, president of the society, was in the chair.

LIVERPOOL ARCHITECTURAL SOCIETY.—At the meeting of this society, held on Monday evening, in the Law Libraries, Cook-street, under the chairmanship of Mr. John Woolfall, F.R.I.B.A., Miss Ethel Charles, A.R.I.B.A., London, read an interesting paper, entitled "Reflections on Architecture," to a numerous and appreciative auditory consisting of members and their lady friends. The president, in introducing Miss Charles, described it as a unique privilege to introduce the first fully-qualified lady architect to his confrères. A moment's reflection would show them that those professions to which ladies had already been admitted had not lost any prestige thereby. As examples he mentioned painting, music, medicine, literature, &c. As to

the possibilities of architecture as a paying profession for ladies time alone would show; but he believed they would be useful members of the profession, more especially in domestic architecture and in the planning of houses, where many labour-saving methods were desirable. Miss Charles, in the course of her paper, dealt principally with London modern architecture, with the object of showing that its quality was as true and noble as that of the old days. She was cordially thanked on the proposition of Councillor W. E. Willink, seconded by Mr. T. E. Eccles.

CHIPS.

The interment took place at Bridlington, on Friday, of Alderman John Rennard, C.C., builder and contractor, Bridlington. The alderman and councillors attended, as well as the representatives of various local bodies, including the brethren of the Londesborough Lodge of Freemasons, of which Mr. Rennard was a P.M.

At the meeting on Friday of Stoke-on-Trent Board of Guardians, the Workhouse Visiting Committee reported that they had visited the men's infirmary and were impressed by the fact that the whole of the painting of the workhouse was done by the inmates, thereby saving about £300 annually to the ratepayers. The Rev. R. D. Cheetham said the master obtained estimates for the painting and redecoration of the workhouse some time ago, and they amounted to £150. The inmates, however, had done the work, and as the materials cost £150, the saving effected was £300.

A new organ, which has been erected by Messrs. Abbott and Smith, of Leeds, in the Salem Church of the Methodist New Connexion, Falconer-street, Newcastle, was inaugurated on Friday. It is a two-manual organ, prepared for three.

Mr. A. W. Pelling, who has just retired from the position of manager of the works department, Guy's Hospital, S.E., has been presented by the staff with a roller-top desk and office chair. Mr. Pelling is commencing business as a surveyor at Hither Green, S.E.

Mr. James L. McDougal, Dalkeith, has been appointed burgh surveyor and sanitary inspector for that burgh.

A fire broke out on Sunday at Hermes Lodge, a 14th-century building of three stories, on Mrs. Biddulph Martin's estate, Norton Park, near Tewkesbury. The outbreak occurred in the oak room, on the first floor. The place was destroyed, only a few articles of furniture being saved. The house had recently been restored and enlarged by Mrs. Biddulph Martin at great expense.

Speaking at a meeting in Prince's Park, Liverpool, on Tuesday night, in connection with the special effort now being made to raise an additional £20,000 for Liverpool Cathedral before the King lays the foundation-stone next spring, Archdeacon Madden justified the choice of St. James's Mount on historic, ecclesiastical, and practical grounds. The cathedral would be the first built in the northern province for 700 years; it would be larger than York Minster, and loftier from floor to ceiling than Westminster Abbey; and its twin towers would be 260 ft. high.

The old bridge over the back stream on the road between Longparish and Barton Stacey, a rough timber structure with a roadway of only 13 ft., lately became decayed and dangerous. The Andover Rural District Council decided to build a new one from plans prepared by their surveyor, Mr. John Wormald. The contract was put into the hands of Messrs. F. Beale and Sons, of Andover, and the steelwork was supplied by Messrs. Bowman and Rogers, of Oxhall Steelworks, and has now been completed. The steel girder and concrete bridge has a span of 18 ft. 6 in., giving a clear roadway of 17 ft. 6 in., with a concrete parapet and a rail fence.

On Thursday in last week foundation-stones were laid of a new Constitutional Club at Melton Mowbray. The club will consist of a two-story building of red bricks and stone dressings, facing Sherrard-street, and replaces three dilapidated cottages and a carpenter's workshop. On the first floor there will be a reading-room and billiard-room, with a spare room adjoining. The two last-mentioned rooms can be thrown into one when required, giving a total area for the combined rooms of 52 ft. by 21 ft. Mr. C. M. Barnes, builder, Melton Mowbray, has secured the contract at £1,749.

The burning question at Colwyn Bay just now is once more the purchase for the town of the Pwllcrochan Woods on certain easy conditions. The estate company are willing to sell them for £7,500, which, deducting the cost of a new road the company are making through the woods, is tantamount to £5,500, as the road will cost about £2,000. The woods are the principal attraction of the town, and the general purposes committee have decided, by a majority of seven to five, to proceed with the purchase.

Engineering Notes.

WEYMOUTH.—The Great Western Railway are about to proceed immediately with the important harbour scheme at Weymouth, for which powers were granted in 1898, and which it is estimated will cost about £200,000. For a long time the company have been seriously hampered, owing to the inconvenience of the present narrow harbour. To improve the old harbour was found to be impossible, and the company now propose to make a new harbour on the Portland side of the Nothe, inclosing about 70 acres of water space between the Admiralty Breakwater and the Nothe Fort. To effect this, two new breakwaters will have to be constructed. This will give a harbour which may be entered at any tide. New jetties and warehouses are to be constructed, and a line is to be run along the Admiralty Breakwater for coaling purposes.

CHIPS.

The Richmond Town Council on Tuesday night consented to the London United Tramways crossing Kew Bridge on a bond of £10,000 to complete the reconstruction portion of the Kew to Richmond line in twelve months.

At Monday's meeting of the town council of Glasgow attention was drawn to the saving the corporation had effected by themselves constructing the sewer in connection with the Clydebank works. They had constructed the sewer at a cost of £78,000, which was a saving of £12,000 on the lowest estimate by contractors.

The present parish church of Longstock, near Andover, built in place of an ancient one from the designs of the late Mr. William White, F.S.A., of Wimpole-street, W., and dedicated upon May 13, 1880, has received from time to time many additions, especially since the advent of the present vicar (the Rev. R. S. Routh) to the living some six years later. A fresh feature has just been added, and was unveiled on Sunday. It consists of a triple-panelled tablet, carved in Hampshire-grown oak, upon which occur a list of the various vicars of Longstock (29 in all), extending from the early years of the 14th century until the present time. The work has been carried out by Messrs. Harry Hems and Sons, of Exeter.

Memorial stones in connection with a new Wesleyan chapel at Millbridge, Liversedge, were laid on Saturday afternoon. The new building will cost about £3,000.

Mr. John Boobyer, of Bidford, Warwick, who died on October 11 last, aged 79 years, youngest son of the late Mr. James Boobyer, of Stanhope-street, Strand, London (of the firm of Messrs. Joseph Hurst Boobyer and Sons, wholesale ironmongers) left an estate valued at £3,887 gross, with net personalty £14.

The British Electric Traction Co. will shortly begin the construction of the electric tramway from Durham to Brandon.

At Nevin, South Carmarvonshire, the parish church is being rebuilt at a cost of £4,000 on a new site presented by the Hon. F. G. Wynn, who is also the largest subscriber towards the outlay.

The sub-committee appointed by the Birmingham Board of Guardians to consider the question of improvement in the heating and lighting of the workhouse infirmary has issued its report, which recommends the expenditure of about £3,950 in putting in new boilers and heating apparatus, and £5,750 for the provision of electric light for the building. This means an aggregate expenditure of £9,700.

The plans committee of Aberdeen Town Council sanctioned at their last meeting 23 sets of plans, which will involve a total estimated outlay of £12,000.

The Methodist New Connexion Allen Memorial Schools, in Park-road, Wallsend, were formally opened last week. The scheme includes a church and schools, the latter being now complete. The estimated cost is about £6,650.

The funeral of Mr. James William L. Hawkins, divisional road surveyor for Cirencester (late surveyor for Keynsham), took place at Brockley churchyard, on Wednesday week. The deceased, who was only 28 years of age, was the eldest son of Mr. James Hawkins, of Brockley, Somerset, road surveyor to the Long Ashton Rural District Council.

On Tuesday, Dec. 1, the Bishop of Worcester consecrated the new church of Holy Trinity at Upper Ettington, Warwickshire. The church is built after designs by Mr. C. Ford Whitcombe, of Newman-street, and consists of chancel, nave with transept, vestries, and south porch; while a lofty tower is to be added as soon as funds allow. The materials used are Broadway stone and oak.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, Clement's House, Clement's Inn Passage, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED.

Telegraphic Address:—"Timeserver, London."

Telephone No. 1633 Holborn.

CHRISTMAS WEEK.

Owing to the interruption of business caused by the Christmas Holidays, the BUILDING NEWS for Dec. 25 will have to be published on WEDNESDAY MORNING, Dec. 23.

All advertisements for that issue, therefore, must reach us before 3 p.m. on TUESDAY, Dec. 22.

Correspondents and others will oblige by sending in Lists of Tenders, &c., at latest by the first post on Tuesday morning, Dec. 22.

NOTICE.

Bound copies of Vol. LXXXIII. are now ready, and should be ordered early (price 12s. each, by post 12s. 10d.), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLVI., XLVII., XLVIII., XLIX., L., LXI., LXII., LXIII., LXIV., LXV., LXVI., LXVII., LXVIII., LXIX., LXX., LXXI., LXXII., LXXIII., LXXIV., LXXV., LXXVI., LXXVII., LXXVIII., LXXIX., LXXX., LXXXI., and LXXXII. may still be obtained at the same price; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Handsome Cloth Cases for Binding the BUILDING NEWS, price 2s., post free 2s. 4d., can be obtained from any Newsagent, or from the Publisher, Clement's House, Clement's Inn Passage, Strand, London, W.C.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 6d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 6d. (or 33fr. 30c.). To India, £1 6s. 6d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 6d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Situations and Partnerships.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" and "Partnerships" is ONE SHILLING FOR TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

* Replies to advertisements can be received at the office, Clement's House, Clement's Inn-passage, Strand, W.C., free of charge. If to be forwarded under cover to advertiser an extra charge of Sixpence is made. (See Notice at head of "Situations.")

Rates for Trade Advertisements on front page, and special and other positions, can be obtained on application to the Publisher.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

RECEIVED.—W. T. C.—P. C. H.—H. W. P.—H. D. B.—N. and M.—V. M. and Co.—F. S.—O. P.

Correspondence.

ASSESSORS AND THEIR AWARDS.

To the Editor of the BUILDING NEWS.

SIR,—The question raised at the R.I.B.A. meeting on this subject cannot be said to be new, and there is almost a nauseating familiarity about the perennial persistency with which it turns up, with all the injustice and hardship entailed upon the profession, who, in these days of competitions, cannot avoid taking part in them. The panacea for all substantial causes of complaint was thought to be found by the establishment of a recognised condition for the appointment of

assessors; but the repeated failures which continually occur, instead of improving matters, tend to aggravate the evil, because committees now naturally enough shield themselves behind the awards of their assessors, who sometimes saddle the promoters of competitions with designs which they themselves realise are unsatisfactory for the purposes intended. So exact is this statement that instances in point are fresh in the minds of all who take an interest in such affairs. I may mention one which happened quite lately in one of the foremost cities in this country. A large establishment for public baths and offices was competed for, and an architect who had had no experience whatever in this class of buildings was appointed from headquarters in London to act as assessor. The premiums were awarded in accordance with his selection, but none of the designs were thought suitable, and subsequently a second competition was held, no assessor being employed, and the building is now in course of execution. A concrete example of failure on the part of an assessor by ignoring specific conditions has recently occurred in another big town, he being, as in the last case, an eminent architect and nominated by the Institute. A series of courts comprised an important feature in a considerable pile of buildings for which there was a competition. The instructions to architects provided that the cells should hold a specified position with respect to the Law Courts. The author of the second premiated design ignored this stipulation; but he took the precaution to obtain the provisional consent of the Government authority in London for the particular arrangement embodied in his scheme, and the assessor seemingly considered that sufficient justification for departing from the rule laid down by the City Council for this particular competition. Now clearly the assessor had nothing to do with any such outside consent or approval, and he ought to have adhered to the conditions set for the determining of the problem in which this special requirement was a leading factor, to secure which many of the unsuccessful competitors had laboured very hard. A contemporary example of the failure of another distinguished member of the Institute Council occurred in the matter of a public library for which a competition was held, he being appointed, as before, as assessor, by the Institute, although a building of this kind does not figure in a list of his own buildings. Over 80 designs were submitted, and the premiums were paid on his award, by which the first place was accorded to an exceedingly commonplace design, while the second was not only that, but also a very poor plan indeed as a library. The town council retained some of the non-premiated designs out of the eighty, and after declining to build either of the assessor's choice, selected one without his valuable assistance. One more specimen of the kind of the thing complained of, and I have done this letter. A church was to be built at a cost of not more than £16,000, and it was set down in the conditions that if either of the competitors estimated his design at more than this sum he would be *hors de combat*, and if the assessor, a well-known R.A., estimated any of the plans at more than ten per cent. above the competitors' estimates, such designs to be excluded. The author of the chosen scheme sent in a plan estimated at his own price of £18,000 without the tower and spire, which he included in his drawings. The result was the church cost £40,000 before it was completed. If such results satisfy the leaders of our profession, or the Council of the Institute, they do not satisfy the bulk of members.—I am, &c.,

O. K.

LIVERPOOL CATHEDRAL.

SIR,—On independent evidence, I may tell you that, undoubtedly, a very keen feeling exists in Liverpool, Manchester, and the North on this subject, and if it is a fact, as is frequently stated, that likely architects, with strong interests and marked ability, were weeded out of the competition to give place to former assistants and pupils, it is not to be wondered at. One thing is very certain, that both Mr. Bodley and Mr. N. Shaw have lost caste, particularly the former, and universally what has happened is considered a lowering of the profession in the eyes of the public. The opinion thus existing is to be regretted, and Mr. Shaw's association with Mr. Doyle in carrying out the Royal Insurance big buildings at Liverpool, the latter being the successful competitor chosen by the former as assessor; likewise his subsequent relationship in the matter of

the Strand Improvement Scheme, the Gaiety Theatre, to wit, tends to strengthen the conviction among many that the protest brought before the Institute last week was justified, and that it represents the feeling of many who do not belong to that body, and many who are not themselves members of our profession.—I am, &c.,
NON-COMPETITOR.

THE "EIGHTY" AT THE INSTITUTE.

SIR,—When the Liverpool Cathedral debate took place at Conduit-street there were, according to the official minutes, eighty members present. Thirty-six voted for Mr. Leonard Stokes's amendment, and fourteen against it; so that thirty members took no part in the voting, because we considered the amendment an adroit *petitio principii*, unworthy of the Institute, and only a trifle less objectionable than Mr. Woodward's first resolution. It would have been more straightforward to have met a direct issue in a straightforward way. Surely the Council might have done that without fear or favour. As it is, courage was wanting, and impartiality is left wandering at large outside.—I am, &c.,
ONE WHO DID NOT VOTE.

BRIGHTON HOSPITAL FOR WOMEN COMPETITION.

SIR,—I quite agree with your last week's correspondent that the proceedings in this matter have been most unusual, and so far as my experience goes without any precedent.

But what did happen is this: All designs were to be delivered not later than Monday, Nov. 9. Immediately after invitations were issued, saying the matron would be "at home" at Mellison's West-street Hall on Thursday, Nov. 12, from 3 to 6, when the designs for the proposed new hospital would be on view, &c.

On the morning of Thursday the competitors received a postcard stating that, "Owing to the fact that several protests had been received against the competitors being allowed to be present at the 'At Home' to-morrow, it has been decided to notify them that no competitors will be admitted to the function."

But this did not prevent any friends of competitors being present, and one hears that at the said function some few of the designs were sought to receive special favour from persons present—viz., Nos. 44, 46, and 25.

Now is it not singular that these numbers received the premiums? The designs, however, do not appear to have been kept so private as they should have been, for I am informed they were seen by others, and what one man could do, another man could have done. Eventually about twelve sets appear to have been selected for final adjudication, and the award was made known in Brighton on the 24th ult., somewhat rather quick work for 62 sets, with reports and estimates, to have been examined, considering what had taken place.

Although we have had the opportunity of inspecting the selected designs, yet I do most emphatically say the same privilege which was extended to the public should have been given to us; and, further, no view should have taken place until after the award.

The question one is inclined to ask is, Are open competitions desirable or healthful to the profession? for in this case here are 58 sets of designs, which probably represent a dead loss of at least £900, literally gone and irrecoverable.—I am, &c.,
ANOTHER COMPETITOR.

SIR,—The justification for the strong expressions of opinion at the Institute last Monday evening, that assessors do not pay sufficient attention to the "conditions" in making their awards, is again brought prominently before the competitors in the above competition.

The condition I refer to is worded as follows:—"Northern windows should therefore be avoided as far as practicable except in corridors, operating theatre, and possibly some upper bedrooms. Yet in the face of this condition the assessor, who all his life has been struggling to obtain as much *sun* as possible into the wards, &c., of his own asylums, places first a design with the *long sides* of the two wards *facing north*, and more than half the side of the maternity ward obstructed on the south side by an escape stairs and sanitary tower. Perhaps, however, the assessor was led astray by the strong resemblance of the elevations to the style of a well-known hospital architect.

I was not a competitor in the competition, fail-

ing to complete my own design owing to other work. I am therefore well acquainted with all the conditions, and, moreover, have seen all the designs sent in, and also the four premiated ones a second time.

The statement in to-day's *Builder* that design No. 46 placed second ought to have been barred from consideration as not providing the staff accommodation asked for, is absolutely incorrect: it provided additional staff rooms, as from a more careful study of the plans would have been seen.—I am, &c.,
NOT A COMPETITOR.

London, Dec. 4.

SIR,—I beg to inclose herewith a letter *re* the above sent to Mr. Holmes to-day, and trust you will find room to publish same.—I am, &c.,
WM. C. F. GILLAM.

Central Chambers, 3, North-st. Quadrant,
Brighton, Dec. 3.

[*copy.*]
Leonard Holmes, Esq., Hon. Sec., Hospital for Women,
76, West-street, Brighton.
Central Chambers, 3, North-st. Quadrant,
Brighton, 3/12/03.

DEAR SIR,—*Re* Hospital Competition. As a competitor in the above, I beg to most emphatically protest against the assessor's award, on the following grounds:—

The design placed first violates the conditions—viz., (1st) "Northern windows to be avoided," (2nd) "Lead flats and skylights to be avoided." The author of the first premiated design has placed one side of the wards due north, and has, I venture to say, about 1,000 to 1,500 ft. super. in lead flats, and has about 12 or 13 skylights of about 800 to 900 ft. super. (I am now speaking from memory).

Apart from many other serious defects in the plan, I consider the above alone should have placed him out of the competition.

Regarding the design placed second, undoubtedly it is the best in the room; but I have had no opportunity to see the other designs sent in, therefore cannot express an opinion whether it is the best design sent in.

Regarding the two designs bracketed third, I would say that one of the designs should have been placed outside the competition on account of violations of conditions as to northern light, beyond being obviously a most expensive design, and could never pass the local authorities regarding the open-air space.

The remaining selected design has omitted the very elementary rules of hospital planning—viz., "cut off" or disconnected lobbies between lavatories and wards. In this case the lavatories open direct into the wards.—Yours faithfully,
W. C. F. GILLAM.

P.S.—I am forwarding copies of this to the building papers.

ARE F.F.R.I.B.A. ALLOWED TO "TOUT"?

SIR,—The other day I had given to me a copy of a professional publication containing a design for a certain institution, the said publication being forwarded, *with the card of the designer*, to the members of a committee who are now considering the preliminaries of a suggested building of a kindred nature. The said designer is a Fellow of the R.I.B.A.

If members of the Institute are permitted thus to "tout," when many unattached practitioners, to maintain the dignity of the profession, always refrain from stooping to such unfair methods, how can we ever hope to obtain Registration, or any other beneficial movement?—I am, &c.,
O. MORES.

RATHER INQUISITORIAL?

SIR,—A communication has reached me from a well-known and respected firm in London—one long closely identified with the building trades, but who are, personally, strangers to myself—relative to an excellent young craftsman (formerly a valued member of my staff), who has apparently applied to them for employment. The letter contains the following printed form, which I am requested (but, on principle, distinctly object) to fill up:—

How long was he employed by you?
In what capacity?
What wages did he receive?
Was he a* good, middling, or indifferent workman?
Was he steady and regular?
Did he keep time well?
What was the cause of his leaving your employment?
Do you consider him honest and trustworthy?
(Signature)

(* Please strike out the words not indicating the character of the person referred to.)

Surely this is very much a resurrection of the offensive "Document," the proposed general introduction of which formed one of the main alleged grievances on the part of the men, and led to the great strike (or lock-out) in London in (if I recollect rightly) the year 1854?—I am, &c.,
HARRY HEMS.

Hotel Blanquet, Elretat, France, Dec. 6.

Intercommunication.

REPLIES.

[12028.]—**Chalk-Gravel.**—See the geological sheets and sections of all counties at Jernyn-street Museum, London. Kelly's "Surrey Directory" has small sketch section and description of chalk; Croydon to North Downs and Thanet beds resting on chalk at or about Croydon, Addington, Sutton, Ewell, and so on to East Horsley.—REGENT'S PARK.

LEGAL INTELLIGENCE.

NEWCASTLE-ON-TYNE IMPROVEMENT SCHEME.—Colonel Ludlow, F.S.I., of Birmingham, the umpire appointed in the cases of the Corporation of Newcastle-on-Tyne v. Simson and McPherson, Dobson, and others, and Piggs Charity, which were heard on October 16 and 17 last, at Newcastle-on-Tyne, has now promulgated his awards, which are as follows:—White House Buildings, Messrs. Simson and McPherson, £22,715; the Turkish Baths and Warehouses, Eric-street, Mr. Joseph Dobson and others, £13,725; the reversionary interest in the above owners, Piggs Charity, £12,733.

AN ARCHITECT'S DIVORCE SUIT.—In the Divorce Court, on Friday, Mr. Justice Barnes, sitting with a special jury, had before him the undefended divorce suit of Spivey v. Spivey and Dixon. This was the petition of John Charles Spivey, an architect, of Leeds, for the dissolution of his marriage on the ground of the misconduct of his wife with Alfred M. Dixon, a member of a firm of brassfounders of Leeds. The co-respondent was a friend of the family, and evidence was given showing that during the absence of petitioner at his club he was in the habit of visiting her house, and staying alone with the respondent for an hour or so at a time. The jury found that misconduct had taken place, and his lordship granted a decree nisi, and directed that a sum of £500, which had been agreed upon as damages, should be paid into court within a fortnight.

IN RE R. S. BUCKERIDGE.—An application was made to Mr. Registrar Giffard on Wednesday for an order of discharge of Richard Smith Buckeridge, who had carried on business as a builder at 37, High-street, Marylebone. The order of adjudication was dated March 30, 1903, and the trustee now reported that proofs would probably amount to £7,554 6s. 10d., and that the assets, which had already produced a sum of £3,825 6s. 9d., might realise a further amount of £600. The bankrupt attributed his insolvency to pressure by creditors, to loss on contracts owing to increased cost of labour and materials, to law costs and sheriffs' and accountants' charges, to bad debts and depreciation in the value of his stock and plant as estimated for realisation. It was reported that the bankrupt's books of account recorded the bulk of his business transactions, but were incorrect and incomplete in some respects. Mr. Registrar Giffard granted the order of discharge, subject to the bankrupt's consenting to judgment for £100. The bankrupt stated that he would consent to judgment for that amount.

Mr. W. G. Watkins has been elected surveyor to the Welton Rural District Council.

Dr. R. W. Johnson, Local Government Board inspector, held an inquiry at the Normanton Urban District Council offices on Tuesday, relative to the proposal of the West Riding County Council to borrow £16,000 for the erection of a joint isolation hospital at Acton Hall, for the townships of Normanton, Altofts, Castleford, Whitwood, and Featherstone.

The city surveyor of Liverpool, Mr. Thos. Sheldrake, has been authorised by the estate committee of the corporation to erect in Everton cemetery an obelisk with suitable inscriptions as to the removal of remains from St. George's Church, St. James's churchyard, and St. Anne's churchyard.

Messrs. R. Hornsby and Sons, Grantham, have been awarded the Government prize of £1,000 in open competition for a military tractor capable of travelling 40 miles with a gross load of 25 tons without renewing fuel or water.

At Wednesday's meeting of the St. Pancras Borough Council, a communication was read from the clerk to the London County Council, conveying the thanks of the Highways Committee of that authority to the borough council for the action taken in giving consent to the construction of a tramway along Tottenham Court-road, and stating that the Improvements Committee had decided to recommend the C. nity Council to proceed forthwith with the authorised widening of the southern end of Hampstead-road, and the Highways Committee had concurred. By 44 votes to 22 the borough council confirmed its previous resolution, and gave its statutory consent to the construction of a tramway connecting with the tramway in Hampstead-road and passing across Euston-road and along Tottenham Court-road to a point opposite the Horse Shoe Hotel.

WATER SUPPLY AND SANITARY MATTERS.

BIRMINGHAM.—The necessity of improving the course of the River Rea at Salfley to prevent the flooding which has invariably followed a heavy fall of rain in that suburb has been under the consideration of the public works committee of the city council for some time past. Plans have been prepared in respect to the work, and these were discussed by the committee at a meeting held on Friday. The idea is to effect an improvement similar to that which was successfully carried out in the neighbourhood of Gooch-street a few years ago. It is proposed to deepen the stream and build brick walls for a distance of three-quarters of a mile from a point on the city side of the Salfley Viaduct to Wile's Mill. The total cost is estimated at £30,000.

LINLITHGOW SEWERAGE SCHEME.—As a result of measurements made by the Linlithgow sewerage scheme engineers, it has been found that water to the extent of eight per cent. of the capacity of the main sewer is finding its way into the sewers from the surrounding ground. In view of the high level of subsoil water at the present time, the engineers have recommended that no steps be taken for the repair of any defects which may be in the sewers until next summer, when the level of the loch and the subsoil water will be lower than at present.

MANCHESTER SEWAGE WORKS.—At the last meeting of the Manchester Association of Students of the Institution of Civil Engineers. Mr. J. Cartwright, M.I.C.E., presiding, a paper was read by Mr. G. J. Fowler, M.Sc., F.I.C., on "The Manchester Corporation Sewage Works." Mr. Fowler gave a résumé of the various steps which led to construction of the present works at Davyhulme, Carrington, and Flixton, to the designs of Mr. Wilkinson, reference being made to the schemes formulated by the late Mr. Lynde and Mr. Allison, and the present city surveyor, Mr. de Courcy Meade. He also related the many problems and difficulties that had to be met in determining the quantities of domestic sewage and trade effluents, and the complex and varying composition of each, mention being made of the various experiments that had been carried out from time to time by Sir Henry Roscoe and others, the results obtained being given in each case. He then dwelt on the merits of land filtration and treatment on contact beds, on the different kinds of material applicable for contact beds; the average cost of construction; the relative areas of primary and secondary beds; the necessity of tank treatment in one form or another; the working of septic tanks, open and covered; the merits of sprinkler beds and close contact beds, &c. In conclusion, he stated that from the experience gained on the Manchester works he was convinced that the scheme now being carried out—viz., treatment first in open septic tanks, by which the mineral and fibrous material are intercepted, followed by treatment over double-contact beds—would prove successful and solve a hitherto perplexing problem. The paper was followed by a discussion, which was taken part in by Mr. W. B. Worthington, Mr. Wilkinson (the engineer for the works), Mr. Congrieve, Mr. Swarbrick, Mr. Mountain, and Mr. Hinnel, M.M.I.C.E.

NEW WATER SUPPLY FOR NICE.—For some time past there has been a movement among the local authorities of Nice with a view to improving and increasing the water supply of the town and its environs. The town council and the water company now being in accord, the work will shortly be commenced. It is proposed to unite the waters of several sources in the vicinity of Grasse at a height of nearly 3,000ft. These are the waters of Gravière, the Bousse, and of the Veguay. This region (owing to the chalky composition of the soil) is uninhabited, and there is, therefore, no danger of contamination. These waters will be, in a short time, conducted direct to Nice from the springs whence they rise. The springs of Gravière are near Benngardin; those of the Bousse near Conségué originate from a torrent in the middle of a chalky stretch of ground, while the springs of the Veguay fall in a cascade opposite the village of Aiglon on the right of the Esteron. These waters will be conducted to Nice by a covered canal from their sources to the consumer's tap. The total length of the canal will be about 40 miles, and it will arrive at Nice at a height of 950ft., on the hill of St. Pierre de Ferie, where a reservoir 32,000 square yards is to be built.

The Duchess of Albany will visit Kingston-on-Thames to-day (Friday) to unveil the Surrey county memorial to Queen Victoria, a memorial tablet to Surrey men who fell in the South African war, and a portrait of the chairman of the Surrey County Council, Mr. E. J. Halsey.

The Wallasey Urban District Council again discussed on Friday the question of a site for the new public offices. A motion to rescind the resolution of the last council adopting the North Mead site was defeated by eleven votes to nine.

Our Office Table.

THE trustees of the National Portrait Gallery have received from Mr. G. F. Watts, R.A., as part of his original gift to the nation, a portrait of the late Right Hon. William Edward Hartpole Lecky, O.M., painted in 1878. This portrait will be placed immediately on exhibition in the Galleries. The trustees have also accepted the three following portraits as donations—viz.: Henry Crabb Robinson, the well-known journalist and diarist, painted by Henry Darvall, and presented by Mr. T. Smith Osler. John Pyke Hullah, the musical composer and teacher—a pencil-drawing by Sir William B. Richmond, R.A., K.C.B., presented by his son, Mr. Francis Hullah, and other members of his family. Mary Ann Paton, the eminent English prima donna, married first to Lord William Pitt Lennox, and secondly to Mr. Joseph Wood—an unfinished sketch in oils by Thomas Sully, presented by her representative, Mr. Robert H. Wood, M.A. The trustees have also acquired by purchase an interesting portrait of Henry Purcell, the famous English musical composer, painted by John Closterman.

THE King has invested Mr. James Knowles with the insignia of a Knight Commander of the Royal Victorian Order, and conferred upon him the honour of Knighthood. Sir James Knowles, who is the founder, proprietor, and editor of the *Nineteenth Century*, and is 72 years of age, was originally an architect, and is still a Fellow of the Royal Institute of Architects. Among his works are the late Lord Tennyson's Surrey House, Kensington House, the Thatched House Club, the public garden and fountain in Leicester-square, and a number of churches. In addition to his professional work, Mr. Knowles wrote a good deal from his earliest years, and originated the *Metaphysical Society*. In 1870 he succeeded Dean Alford as editor of the *Contemporary Review*, but seven years later, on a change of proprietorship, he founded the review he has since conducted with such conspicuous success. The introductory sonnet was written by Lord Tennyson, who for many years was his constant companion. Mr. Knowles had been on terms of close friendship with many of the leaders of thought of his time.

THE post of Professor of Painting at the Royal Academy, which has been vacant since the resignation of Mr. Val Prinsep, R.A., last February, has been filled up at a general assembly of Academicians. The choice of the Forty fell on Mr. George Clausen, A.R.A., and on Mr. Clausen will devolve the duty of delivering six lectures on painting in January and February. Mr. Clausen's lectures are likely to be largely attended, for his election is one that will meet with the approval of many who do not ordinarily support the Academy. While a student at South Kensington, Mr. Clausen gained (in design) two gold and two silver medals in the national competitions and a national scholarship. He has also been awarded medals, in Paris in 1889 and 1900, at Chicago in 1893, and in Brussels in 1897. At the age of twenty-four he exhibited a picture in the Royal Academy, "High Mass at a Zuyder Zee Fishing Village," and for some years he painted Dutch subjects. Among his best-known works are "The Girl at the Gate," which was purchased by the Chantrey Trustees; "Labourers at Dinner," "The Ploughboy," "Brown Eyes," "Mowers," "Evening Song," "Turning the Plough," and "The Mother."

UNDER the auspices of the Hampstead Art Society, Mr. Henry Rose gave on Friday night, in the town hall, Haverstock Hill, an illustrated lecture entitled, "From Phidias to Flaxman: the Story of Sculpture." Mr. Rose characterised sculpture as frozen music and poetry, and, after laying down the principles of the art, proceeded to illustrate the work of primitive man, following on with that of Egyptians, Assyrians, and Greeks. This led to the introduction of the labours of Phidias and the beauty of the Elgin marbles; then followed reference to Praxiteles and later Greek work—the Apollo Belvedere, the Dying Gaul, the Laocoon of the Vatican, and Aphrodite of Melos. Early Christian sculpture came under review and illustration. Modern sculpture, with the productions of Canova, Thorwaldsen, Rauch, and Flaxman, followed in review, and the lecture closed with references to the Albert Memorial Chapel, Windsor.

NEGOTIATIONS have been proceeding for some time with a view to the amalgamation of the two

organisations which represent sanitary inspectors in England and Wales—the Sanitary Inspectors' Association and the National Union of Sanitary Inspectors. The Association, which has its headquarters in London, has a membership of about 700, whilst the National Union, which was founded in 1887 as the North-Western Sanitary Inspectors' Association, is about 400 strong. Liverpool may be considered to be the centre of its activities. A quarterly meeting of the executive council of the National Union was held in the Manchester School of Technology on Saturday, when Mr. H. H. Spiers, of West Bromwich, the chairman, reported favourably on the progress of the negotiations. The Association, an incorporated body, has already altered its articles of association so as to meet the views of the members of the Union, and heads of agreement respecting details of administration have also been drawn up by the chairmen of the two organisations. Mr. Spiers reported that the Association had conceded everything which the Union had asked for. The executive approved the heads of agreement. Four delegates were appointed to attend the meeting of the executive of the Association in February, and the hope was unanimously expressed that the arrangements for amalgamation will then be completed. In the event of an agreement it is intended that the Union shall be dissolved, and the members elected *en bloc* as members of the Association.

THE Worshipful Company of Plumbers have issued a note drawing attention to the great improvements in the qualifications of plumbers which has resulted from the system of registration established in 1886. They recommend that all plumbing classes should be placed under the direction of committees on which the local education authority, the master plumbers, and the operative plumbers are represented. A syllabus has been drawn up for the use of plumbing classes, and examinations (preliminary, intermediate, and final) are held at regular intervals in both the theory and practice of plumbing. In connection with this system of technical training a form of indenture of apprenticeship has been drawn up by the Company, and has been accepted in principle by both employers and workmen. This indenture seeks to combine the ancient system of apprenticeship with modern methods of technical education. It provides that the apprentice shall attend evening classes, and at regular intervals present himself for examination.

THE Association of Chambers of Commerce of the United Kingdom have received an important communication from the Postmaster-General, giving useful information regarding the progress of the underground telegraph line to the North. The temporary wires in the pipes between Birmingham and Warrington are being replaced by a permanent cable. Seventy miles of this cable have been drawn in, and when the remaining twelve miles are drawn in there will be a permanent underground system between London and Birmingham, Manchester, and Liverpool. There are already underground wires between Warrington and Manchester and Liverpool. The laying of the pipes north of Warrington to Carlisle is progressing, and the work will be finished this month. Temporary wires have been drawn in as far as Wigan, and will be continued to Preston. A permanent cable to Carlisle will be provided later. In Scotland it has not been possible at present to undertake more than one section of this work. That section is over the Beattock incline, where the overhead wires are much exposed, and the pipework is completed. Pipes are also being laid north-eastward from Manchester to Leeds, and temporary wires will be provided, to be replaced later on by a permanent cable. This work will be completed before the end of the financial year.

LORD JAMES OF HEREFORD has just signed his final award as umpire in the arbitration on the use of lead glaze in the making of pottery. His lordship's final award, dated November 28 last, establishes a new rule 2, under which it is generally provided that after February 1, 1904, no glaze shall be used which yields to a dilute solution of hydrochloric acid more than 5 per cent. of its dry weight of a soluble lead compound calculated as lead monoxide when determined in a manner prescribed by the rule. The use of a glaze "which does not conform to the above-mentioned conditions" is, however, to be permitted after due notice to the inspector for the district, subject to the adoption by the manufacturer of a new schedule of compensation to

employees who may be suspended on being certified as suffering from plumbism (or lead poisoning), and subject also to periodical examination of the employees by the certifying surgeon. China scouring is excluded from the processes dealt with by these regulations. The prescribed method of testing the glaze is as follows:—"A weighed quantity of dried material is to be continuously shaken for one hour at the common temperature, with 1,000 times its weight of an aqueous solution of hydrochloric acid containing 0.25 per cent. of HCl. This solution is thereafter to be allowed to stand for one hour and to be passed through a filter. The lead salt contained in an aliquot portion of the clear filtrate is then to be precipitated as lead sulphide, and weighed as lead sulphate."

The members of the National Association of Master House Painters and Decorators will hold their eleventh annual conference in Manchester next September. To mark its importance and provide funds for the equipment of the new school of decorative painting and the educational work of the association, they intend to hold an exhibition of decorative and applied arts, processes, and manufactures in St. James's Hall in that city. The exhibition will include furniture, carpets, hangings, furnished rooms, wallpapers, relief materials, paints, colours, and varnishes, water paints, tiles, pottery, sanitary appliances, and stained glass. An important section will be devoted to "processes," where various handicrafts will be seen in actual operation.

The Bristol Corporation Baths Committee have provided a suite of baths on Kane's system at the new buildings on Barton Hill. In this new system of baths, the only one of its kind in existence, instead of the bather undressing, bathing, and dressing in the same temperature, a central hall is provided, down the centre of which are placed the bath compartments. On each side of the walls of this central hall are placed the dressing-rooms, each with a door in the wall of the central hall corresponding with the door of a bath compartment. The central hall, in which are placed the bath compartments, is heated to over 100°, while the dressing-rooms are heated to about 65°. The ordinary type of slipper-bath is fitted in a cubicle, which also serves as a dressing-room, with the consequent result that if the compartment is heated to a temperature suitable for a bathroom, it becomes too hot for a dressing-room. On the other hand, if the room is heated as a dressing-room, the bather must, after immersing himself in water heated to 98°, stand in air at 65°. In Kane's system, whatever the temperature of the bath may be, the air of the bathroom is always higher.

SIGNOR PASQUI proposes to re-erect in Rome, at an estimated cost of some £4,000, the famous Ara Pacis, erected to Augustus when by many desperate wars he had pacified the world. It was among the most striking monuments of Ancient Rome, and its recent rediscovery is one of the most important archaeological events of recent years. In 1500, and again in 1859, chance excavations revealed minor portions of it, which were dispersed in various collections. The remainder came to light in the course of last summer during the progress of excavations in the Piazza San Lorenzo in Lucina, near the Corso, under the charge of Signor Pasqui. A mine of architectural and sculptural wealth was discovered in the course of a few months, including the whole of the Ara Pacis, save two fragments resultant on the above-mentioned earlier researches. It is now suggested that it be erected in its entirety, not in the open air, but in some such position as the covered-in court of the baths of Diocletian. Professor Pasqui declares that it would not be difficult to reassemble those previously found portions now dispersed in various collections in Italy and abroad. The greater proportion are in the Uffizi at Florence, belonging to the State. Other fragments are in the Vatican, and should not be difficult to obtain. It might, however, be less easy to secure those now in the Medici Villa, the Paris Louvre, and the Vienna Museum; they are, however, comparatively unimportant, and could be, if necessary, reproduced in facsimile.

UNEXAMPLED activity has characterised the building trade in Canada this year. The lack of men and material is stated to have seriously curtailed the building operations necessary for current requirements. In Winnipeg, a typical centre, upwards of 6,000,000dols. (£1,200,000) has been spent on new buildings alone during the present year, comprising 1,200 dwelling-houses, 65 stores,

and several new churches. Under the influence of this pressure the building season in Canada is extending year by year, and bricklaying now goes on almost up to Christmas. Carpenters and joiners can also be similarly engaged in outside work, to be followed with sufficient inside work to keep most of them going throughout the winter.

A WRITER in *L'Industrie* gives the following as a method which he has proved to be successful for drying out damp walls and humid surfaces: Dissolve 5lb. of pure olein in 5lb. of benzine, and coat the damp surfaces with the mixture. This solution of oleic acid, owing to its great fluidity and the capillarity of the mortar, sinks deeply into the latter, and, together with the hydrated lime in the mortar, produces a formation of greasy lime which constitutes a waterproof coat. The proportions of the mixture can, of course, be modified according to circumstances; and, instead of benzine, other solvents of the nature of ether and benzol may be utilised. A variation of this method is the employment of other fatty or resinous acids instead of olein. The resinous acids form with the lime hydrate a resinate of lime which has the same waterproof properties as fat lime. Damp or newly-built walls thus coated may, after almost instantaneous evaporation of the liquid, be papered or painted. In the case of walls in cellars or tunnels, this process can be also employed successfully to coat cement, terrazzo, or mosaic work.

CHIPS.

The dedication and opening of the new organ at St. Werburgh's Church, Chorlton-cum-Hardy, took place on Friday evening. The organ has cost £725.

An inquiry was held at Milton, near Lymington, Hants, on Thursday in last week, by Mr. Tulloch, an inspector of the Local Government Board, with reference to the proposed borrowing of £5,500 for the purpose of drainage works at Milton.

The general purposes committee of the Poplar Council have approved the proposals of the London County Council to seek powers next session to construct tramways from East India-road, through the Blackwell Tunnel, to Greenwich.

At a meeting of the Blackburn Queen Victoria Memorial Committee on Thursday evening in last week, it was resolved to instruct Mr. Bertram Mackennal, the sculptor, to proceed at once with his marble statue of the late Queen, to be erected on the boulevard near the railway station. The statue, which will show her Majesty in a standing position, is to cost £2,500.

At Avonmouth, Bristol, on Friday, memorial stones were laid of a new Wesleyan school chapel. Messrs. La Trobe and Weston, of Bristol, are the architects, and Mr. E. Love is the builder.

The Bishop of Leicester consecrated, on Sunday, in Sepulchre's Church, Northampton, one of the four round Templar churches of the country, a stained-glass window in memory of the 98 non-commissioned officers and men of the Northamptonshire Regiment who died in South Africa during the war. The window, placed in the south aisle, is of three lights.

On Thursday in last week, Col. Yorke attended at Walsall on behalf of the Board of Trade for the purpose of inspecting the new tramway lines which are to be opened on January 1, when they will pass into the control of the Corporation. Accompanied by members of the council and chief officials, Col. Yorke was taken over the whole system, which extends to Walsall Wood and Willenhall and to the borough boundary in three other directions.

The highways committee reported to the London County Council on Tuesday that it is hoped that it may prove possible to commence the electrical working of the New Crose and Greenwich, &c., sections of tramways by the end of the present year. The reconstruction of the tramways is completed and the electric cables are laid, while the arrangements at the sub-stations and for the provision of the supply of power from the London Electric Supply Corporation's station at Deptford have reached an advanced stage.

A lecture, entitled "Decorations Past and Present," was delivered by Colonel R. J. Bennett, of Glasgow, president of the Association of Master Painters of Scotland, to the Edinburgh and Leith and Vicinity Master Painters' Association in Dowell's Rooms, Edinburgh, on Friday night. Mr. J. R. Muirhead presided over a good attendance.

The new church of St. Mary Magdalene in Pockthorpe, Norwich, was consecrated by the Bishop of Norwich last week. Late Perpendicular in style, it is built of brickwork, with Monk's Park stone dressings. At present only the chancel and four bays of the nave have been erected at a cost of £4,000. Mr. A. J. Lacey, of Norwich, is the architect.

MEETINGS FOR THE ENSUING WEEK.

MONDAY.—Incorporated Institute of British Decorators "The Management of Decorative Work in Progress," by John D. Crace, President. 8 p.m.

Royal Institute of British Architects. "The Royal Victoria Hospital, Belfast," by William Henman and Henry Lea. 8 p.m.

Society of Arts. "The Mining of Non-Metallic Minerals." Cantor Lecture No. 4, by Bennett H. Brough. 8 p.m.

Surveyors' Institution. Discussion of "Model Building By-laws." 8 p.m.

Incorporated Clerks of Works Association. "Ingram Houses Residential Clubs," by Arthur T. Bolton, A.R.I.B.A. 8.30 p.m.

TUESDAY.—Institution of Civil Engineers. "Deposits in Pipes and other Channels Conveying Potable Water," by Prof. James Campbell Brown, D.Sc.; "The Purification of Water Highly Charged with Vegetable Matter; with Special Reference to the Effect of Aeration," by Osbert Chadwick, C.M.G., M.Inst.C.E., and Bertram Blount, Assoc.Inst.C.E. 8 p.m.

Society of Arts. "The British Silk Industry," by Frank Warner. 8 p.m.

WEDNESDAY.—Society of Arts. "The Science of Taxation and Business," by Sir W. H. Preece, K.C.B. 8 p.m.

Trade News.

WAGES MOVEMENTS.

THE NORTH WALES SLATE TRADE.—A meeting of quarry-owners in the Nantlle Vale and other districts of Carnarvonshire was held at Carnarvon on Saturday, under the presidency of Mr. John Menzies, for the purpose of revising the price list. It was decided not to make any change. The state of the trade was reported good. It was understood that the owners of the Penrhyn and Dinorwic Quarries have also agreed not to change the price list.

A general meeting of the Freemasons of the West Lancashire province was held on Wednesday at Liverpool, to consider and decide upon the provincial grand master's wish that the brethren should erect some special portion of Liverpool Cathedral. After considerable discussion it was resolved that the money subscribed during the next five years should be devoted to the erection of a chapter-house as a memorial to the late Earl Lathom.

At the Carpenters' Hall, on Wednesday night, Lord George Hamilton, M.P., distributed the prizes and certificates gained during the past session by students at the Trades' Training School, Great Titchfield-street, which is conducted by the Carpenters' Company in conjunction with the Joiners', Paper-Stainers', Plasterers', Tylers' and Bricklayers', and Wheelwrights' Companies. The chair was occupied by Mr. Percy Preston (Master of the Carpenters' Company). Mr. John Willson (chairman of the joint committee) stated that there were twelve classes in the school, eleven of which were closely connected with the building trade. The school differed from all other technical schools by insisting that all students must be connected with the trade as working members before being admitted, thus supplying that instruction which was formerly provided by trade apprenticeship. There had been a decline in the number of students from 260 in 1901-2 to 241 in the past session.

THE BUILDING NEWS

AND ENGINEERING JOURNAL.

VOL. LXXXV.—No. 2554.

FRIDAY, DECEMBER 18, 1903.

BUILDING METHODS AND THEIR ORGANISATION.

SUCCESS in most occupations largely depends on efficient organisation, a due relation of one part of the work to the other parts, so that there may be no friction or overlapping. A good deal of the professional architect's work is lacking in this quality. His earlier years are taken up with profitless studies of no practical value to him. His book and class studies bear very indirectly on the practical work he is called upon to undertake; he spends much of his time in drawing and sketching, which are of doubtful value to him, and have little relation to the practice of his vocation. But it does not end here. When he begins to practise he finds the same want of relation, the same obstacles to his action in the requirements of clients, local authorities, and builders. A great deal of his energy and ability is wasted on preliminary duties of not a very remunerative kind; he has to prepare plans and designs to suit various tastes before one is selected. The architect has got the wrong client, or the client the wrong architect, for his particular wants. They do not suit each other. The fact is, as it often happens, the architect does not know his client well enough to design a house for him.

A Philadelphian architect lately gave his experiences, in a paper read at the Ontario Association of Architects at Toronto, on a first interview with his client. The client said first he would like to see the house that the architect would design for him, and then he gave the architect his instructions about the number and size of rooms, &c. The architect replied he could do that, but honestly admitted that, if such a house was built according to bare directions, the result would be disastrous, for he did not know the client well enough. But the client was satisfied, for he began to see and "realise that the house was to be his house, not an architect's house merely." The man who comes to an employer and says, "Give your house to me to design; I can refer you to Squire So-and-So, who was highly satisfied, and do not bother about the design; I will guarantee to suit you at a certain cost, &c.," is not the man to be trusted, for he cannot suit another man's taste or habits of life. The house or building "must fit the man in some way." It is not every architect who has the responsive feeling to find out the kind of house a client needs. A man of common or vulgar tastes will want a very different design to a man of culture. Then there is a lack of organisation in our business methods which our American brethren do not experience. When our architects are instructed to proceed with a building, it is not all smooth sailing. Perhaps the architect has forgotten to conform to a local by-law or regulation, and the plans have to be altered to pass the authority. And this may happen after the contract has been signed. A delay follows, during which time very important preparations could have been made by the contractor; or perhaps the trenches have been dug out, when the order comes to set them all back. Often the time is spent in negotiations which ought to have been settled before the builder was engaged. A certain period for completion of works has been fixed, so that, when the work is resumed, the contractor is at a serious disadvantage. He has been unable to make arrangements with his foreman; materials which could have been ordered and delivered are delayed; he is unable to organise his staff of workmen to

the best advantage;—all of which are serious drawbacks to him. The building will cost him more. But a considerable cause of delay to the contractor is the non-completion of the drawings and details, chiefly the fault of the architect. Inadequately supplied with these and the necessary instructions, the contractor is at a loss to know what his work is, and how to organise it to his advantage. It is a common cause of complaint with the builder. The proprietor wishes the work to be begun at once, so the architect just scrambles through his drawings in pencil for the quantities to be prepared and the tenders sent in. A tender is selected, and the contractor signs the contract; but his work is at this early and important stage delayed by not being supplied with the drawings and details. The builder is thus hurried to commence before his instructions are complete. As we have seen, the American architect is far more thoughtful in his method in this respect; he rapidly completes the drawings and details in order to enable the contractor to organise his work and to know what he has to do—a matter of extreme importance to him if he is to make a fair profit. The architect in the States takes great trouble in making his drawings complete. If it is a steel skeleton building, he employs a specialist in steelwork to assist him in the design and details before going to contract; if there is much machinery or plant to be provided, a mechanical engineer is called in to co-operate with the architect. There is no question of expense, as the proprietor pays gladly for any special aid, mechanical or otherwise, to complete the work at an early date. But the architect in this country seldom incurs any expense in aid of this kind; he appears to think that expedition or hurry is detrimental to the building, and that if the details are supplied during the progress of the work it is sufficient. Yet such a view leaves out of consideration entirely the contractor's interest, which is exactly the reverse. The sooner he has definite instructions and the whole of the drawings, the better able he is to husband his resources to the best advantage, to organise labour, to order the materials in time. And it is the more urgent to him if the time of completing the building be short. It is in such a way as this that English building practice is wanting in that smoothness that characterises building operations in America and other countries; it is one of the main causes of that dislocation between the architect's and the builder's work which is so detrimental to honest and sympathetic design; as, for example, in requiring in the drawings certain things to be done in a certain way, and withholding the very means of complying with them during the progress of the work; in providing a period for the completion of the building, when at the same time the contractor has been prevented from performing the work by not receiving the detail drawings soon enough. Thus the architect, often unknowingly, by the method he adopts, withholds from the contractor the very means by which he can accomplish his work. How often, for instance, the contractor, not receiving a detail in time, executes the work in a different way to that the architect intended; it is not approved, and the loss falls on the contractor. A week or month saved in the preparation of the drawings is so much gained in the quality and finish of the work, besides a pecuniary gain to both employer and builder. In this neglect of supplying the drawings and details at an early date, we have an instance of the want of system and method and connection between the architect's work and the contractors. The interests of the architect should be those of the contractor, the aim ought to be to aid and assist the carrying out of the design; instead of which the practice we have mentioned illustrates in a forcible manner the lack of co-operation between the

architect and contractor. Each seems to be pulling in an opposite direction. In the preparation of the design, the builder is rarely consulted, even if that were possible, and the idea seems to be to conceal from the contractor the design as long as possible in the hope that he will not be able to obtain any advantage by a too early knowledge. Such an idea is too absurd to entertain, because it is more likely that the contractor will do the best with the design, and make the execution more acceptable to the architect, if he has ample time to make the necessary preparations and obtain the best hands for the work. An early delivery of the drawings and details insures, amongst other things, a study of the building, and the best means to meet the architect's wishes; the contractor has time to consider how best and most economically to set to work; there is more scope for any suggested alteration in the design; the contractor is better able to organise his labour. The work must benefit, as the early supply of the drawings means more careful consideration, the ordering of material in time, the selection of better hands to carry it out. In America, where buildings are carried out with great expedition, early delivery of drawings and details is held to be of the utmost importance, and the profession are trained to a sense of the necessity of rapid working. We are not quite of the same opinion in this country; quality, and not speed, are required by us. Rapidity of execution often means hurry; a want of study as to the best means to the end; instability, and resort to mechanical labour. Yet one of the advantages of the speedy furnishing of drawings was to be seen in the erection of steel buildings, as those in the States. Here the steelwork is practically ready before it is required on the building. The drawings are supplied to the contractor, who often has a special staff of engineers, and the steel is rolled and superintended under their supervision; but in this country we know how a quantity of steelwork would be carried out. The architect's design would probably be submitted by the contractor to an expert steel maker, who would give a tender for the work, he being allowed to make certain modifications and practical details; but the drawings would not be ready till after the contract had been signed, which would lead to disagreement between the contracting parties; or if the contractor undertook to provide the steel construction, he would have to wait for the details, and the consequence would be a delay in the execution of the order, or an attempt to substitute a less costly design. In either case there would be considerable delay in execution. In the ordering of terracotta work we know also the importance of expedition. Drawings and details ought to be furnished before the works are commenced, as much time is taken up in the pattern moulding, drying, and firing.

Another of the hitches in modern building methods is caused by the want of co-operation between the architect and the builder or crafts employed. How few architects ever take the trouble to consult the workers in making their details. Take an instance. The building includes a number of stone columns or mullions, and a long run of stone cornices. Before making the working drawings it would be a decided advantage to talk the matter over with the practical mason, who would in most cases be able to suggest to the architect more economical dimensions, or sections that would be easier worked, or a better plan of jointing. In the design of terracotta work, a consultation with the manufacturer would be decidedly desirable before making the large scale drawings, so as to avoid any undesirable profiles, which would cause uneven shrinkage and warping. Before the drawings of iron and steelwork are prepared an expert in such construction should be consulted as to the depth of girders and beams, stanchions

and columns, or trussed roofs, and thus save many alterations that would be costly. Much waste of material and labour could be avoided if the architect had interviews with the carpenter and joiner, for he would be able to suggest simpler and better modes. In the design of such work as lead-glazing, tile-work, ornamental plaster work, the architect would find it to his advantage to consult the artists engaged, and a frequent visit to their workshops and studios ought to be considered a necessary condition of design. The consequence of the present "stand off" policy adopted by the professional man is that the trades do not understand the architect. He speaks in a language not understood by the operative artist, his drawings are often awkward and unsympathetic with the materials and methods used, if not impracticable to work. He shows the detail to the foreman or builder, who recommends a modification, or it is referred to the architect to explain. A delay in the execution of the work occurs, and the intention of the architect is often frustrated. The co-operation of the designer and workman is the only way out of the difficulty. In the earlier ages the designer and craftsmen were one and the same, and the hiatus was avoided. In such work as sculpture, carving, and metalwork there can be no true and honest art under the modern conditions. The misinterpreted details, the starved and pinched stonework and joinery, the eccentric and grotesque ornament, the want of harmony between the general design and the details of fittings, are all evidences of the want of co-operation, of continuity of intention, of the utter discordance between the architect's design and its performance by men who have only a commercial interest in the scheme. The separation or disjunction in our building methods, the want of relation and dependence in the architect's studies, are evils which we are only slowly beginning to realise. A comparison with the methods adopted in the United States has shown an inclination to accentuate the separation of the two branches of practice, design and execution, and to place certain hindrances in the way of a mutual agreement and co-operation, though in many qualities and trades connected with building and industry our work cannot be surpassed.

THE ROYAL ACADEMY SCHOOLS PRIZE DESIGNS.

ON the whole the designs and drawings submitted for prizes by the Royal Academy Schools are not equal to the work of former years. The landscape painting examples are certainly unsatisfactory; there is much crudity in colour and composition, and the paintings awarded the prizes are distinctly the best, if not the only ones which deserve the award. The subject, "An Express Train at Sunset," for the Turner Gold Medal and Scholarship of £50, was a difficult one, because a train at all times is not a very picturesque object to handle in a landscape. Mr. John Hodgson Lobley has won the prize, and has certainly treated the subject cleverly and vigorously—a train passing over a bridge, while a number of railway navies are standing below. The other landscape subject, "A Bank of Ferns or Bracken," for the Creswick Prize, which has been won by Walter Percy Day, has not been done justice to by the majority of students, whose large cold green canvases often show a lack of harmony and gradation of colour. For the historical painting, "The Meeting of Diogenes the Cynic and Alexander at Corinth," the gold medal and travelling studentship of £200 has not been awarded, though No. 2 is the best in composition. The subject was difficult, and only one or two attempts can be said to be at all satisfactory. From painting we may turn to the architectural subject given this year, "A

Domed Church," for which the gold medal and travelling studentship (£200) has been awarded to Lionel Upperton Grace. The subject was a good one, though, taking the designs submitted, only one, the chosen design, has satisfactorily treated the problem. Mr. Grace's design exhibits unquestioned ability in the plan and general conception. It is dignified, though the proportions are not quite pleasing, and there is a heaviness in the general profile and details. The lower story or order looks weak, and the dome is rather heavy and depressed in outline; but these are points which could be improved. The general scheme is good. The author's plan is a rectangle, divided internally into three main or equal divisions in length, the central compartment being covered by a dome 40ft. diameter, supported on four massive piers. The dome and the western bay form the nave, and the chancel and sanctuary, terminating in an apse, form the eastern portion. There is thus internally a cruciform distribution of area, the north and south arms or transepts being cut off from the domical area by two columns under the main arches which carry the sides of dome. Above this colonnade which divides the domical area from the transepts, the walls on each side are carried up as a clerestory pierced by one large centre window, and these walls form the base of dome on the north and south sides, and become external walls between the cupolas which accentuate the four corners of the building. The effect of the clerestory thus being set back in the view gives variety to the composition, and breaks up the building at the side, and would assist the effect of light and shadow. The four corners of the plan adjoining the transepts crowned by cupolas above are on the west appropriated to an entrance to aisle on the north side, and to a baptistery on the south side of entrance. At the eastern end a memorial chapel occupies the northern corner and a morning chapel the south corner, both being finished with apsidal ends. The sanctuary being also apsidal, and covered by a half-dome, the plan assumes a triapsal termination. The west square-headed window over entrance is too wide and squat in proportion. The walls are rusticated. Internally the upper part is rendered rather heavy by the large spaces into which the domes are divided by ribs, and the lack of detail or sculptural enrichment. The square-headed windows which light the base of the dome are rather meagre. We hope to publish the design.

Design No. 161 is remarkable as a heavy Doric single-storied structure of massive character, rusticated with a centre circular drum, crowned by a flat dome. The external walls form a rectangle, broken on each side by two projections for stairs to crypt, verger's room, and baptistery, and between these are columnar side entrances. The dome, with the western part of nave and the choir and sanctuary, form a long internal rectangle, terminated by circular interior apses; but under the dome the sides curve outwards between the main piers, and are enriched by coupled columns, which divide the curves into three. The effect would no doubt be striking, and a large area would be obtained for seating. The high altar stands forward before the inner apse under a baldachino, and at the west end is a projecting portico of massive Doric columns. Externally the effect is extremely heavy, with the rusticated imperforated walls and attics and flat dome. The organ gallery is at the west end, and the choir is provided for in gallery round dome. There is some sculptural detail, and a group over west front is well shown. The design is essentially experimental, and we may say clever; but its undue severity of type is contrary to the spirit of modern church architecture. The inner dome, which rests on a peristyle, which forms an inner gallery round the dome, is a good feature. No. 162 is conceived in a Romanesque style.

It is cruciform in plan, with nave, transepts, and choir. The central dome over crossing rests on four square massive clusters of piers at each corner. The chancel has a circular end, and there is an ambulatory round altar screen. The west end is flanked by two towers, octagonal above, with cupolas, with a large, deeply-recessed wheel window, the curve of which is continued as a gabled end between the towers. The transepts also have similar windows. The details lack refinement. The nave, of two bays 40ft. wide, is the same width as the dome and the transepts. There are five steps up to choir, and the sanctuary is well raised. A clergy vestry is on north side at the end of aisle, and a morning chapel on the south side of chancel. The sittings are shown in plan.

No. 159 is an extraordinarily whimsical design. From a cluster of small domes springs a colossal pointed dome, pierced by traceried Gothic windows, and divided by heavy ribs of masonry. The horizontal bands of coloured material which are carried through the masonry of the lower cupolas give the design a very streaked appearance. The plan resembles one of a church at Cologne, the sanctuary and transepts terminated by circular ends, while smaller apsidal chapels open from the angles, and the general outline of section across transept is a trefoil. Other designs (Upper School) include one for village church on a hillside. No. 175 is simple and picturesque, with short towers at the east end, by side of chancel. The west elevation is simply treated, and the detail clever. No. 177 is a neat set with central tower. No. 180 is an artistic treatment with tower over choir. No. 171, a Secondary Technical School for 100 boys, shows an assembly hall in centre, with master's room behind; on left is a wing, with corridor leading to physics laboratory, and a cloak-room at end in front, and a similar wing on the right contains four classrooms; on the first floor are a chemical laboratory, lecture-room, store, dining-room, &c. No. 170 has some good points. No. 169, a Branch Insurance Office, is a well arranged plan, but commonplace in elevation. No. 167 is a design for a Morning Chapel next a cathedral, showing skill in Gothic (Decorated) detail, and William E. Brooks is awarded the prize of £25. There were also exhibited designs for a railway station, for a small country town, for a covered bridge, for a drinking fountain. Some of these show talent in conception, others in detail. The subject, "Plan of a General Hospital" (prize £10), has not been awarded. Four designs are submitted. 187 shows some careful study of pavilions and centre blocks, with long covered corridors. No. 188 is rather crowded. No. 189 has a fairly good general plan, with terrace connecting ward blocks, and No. 190 is a well-balanced plan, and the varied arrangements show some knowledge of the problem.

The perspective drawings on outline (open to architects only) represent the interior of hall of Eltham Palace, and indicate skill and industry in the constructional lines. The silver medal is awarded to Percy Ion Elton. The first silver medal for a set of architectural drawings of the interior of St. James's Church, Piccadilly, is won by Leslie Wilkinson, and a second by James de Caynoth Ballardie. The drawings represent a longitudinal and cross view of the church shown in section, and show the fine enriched plaster-vaulted ribbed ceiling over nave, and the cross-vaults over galleries. The silver medal and prize of £25 for a cartoon of a draped figure, subject "Victory," has been awarded to William E. Gladstone Solomon—a seated female figure, her right hand uplifted, and the left holding a deer-horn stringed instrument. The pose of figure is clever, and there is a triumphant expression in the face. The drapery is also well drawn. We hope to illustrate this work. The design for the

decoration of a portion of a public building, for which a prize of £40 was offered, has been won by Lillian Price Edwards, and a similar prize by Walter Ernest Webster for a clever composition, *proxime accessit*. The subjects given were generally appropriate, if difficult in some cases, and called out the powers of invention and composition of the students. In the competition for a model of a statue the silver medal has been given to a clever work by Louis Fritz von Roselieb; but the second medal was not awarded. The design for a commemorative medal of the Durbar, by Henry William Page, gained a silver medal.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE ordinary fortnightly meeting of the Royal Institute of British Architects was held on Monday evening, at 9, Conduit-street, W. There was an unusually numerous attendance of members, brought together by the introduction of a keen discussion on Plenum v. Natural Ventilation, as applied to hospital construction. Owing, however, to the length and detailed character of the papers read, and the time taken by the speakers first called upon, this expectation could not be realised, and it remains to be seen whether the Council of the Institute will be able to accede to the requests of those who asked that a second evening should be devoted to the subject early in the New Year. The President, Mr. Aston Webb, R.A., F.S.A., occupied the chair, and in opening the proceedings, proposed a vote of condolence to the family of the late Mr. Charles Fowler, Fellow, who was beloved by many in that room. His father was one of the founders, and for some years one of the hon. secretaries, of the Institute. The gentleman just deceased was for many years surveyor to the Portland Estates, a position from which he retired a year or two since. He was a very active worker at the Institute, on whose Council he served, and he was also a member of the Board of Examiners. The deaths were also announced of Mr. William Warlow Gwyther, of London, Fellow, and of Mr. Nathaniel Young Armstrong Wales, Fellow, of Dunedin, New Zealand.

THE ROYAL VICTORIA HOSPITAL, BELFAST: ITS INITIATION, DESIGN, AND EQUIPMENT.

Two papers were read on this subject by Mr. WILLIAM HENMAN, of Birmingham, the architect, and Mr. HENRY LEA, the engineer of the hospital described. Plans and sections were hung on a screen, and about a score of lantern slides, showing the plan, construction, and actual building, were exhibited. Mr. Henman said there was much that was unique in its inception, original in its design, and novel in its equipment, which had attracted attention to the Royal Victoria Hospital, Belfast. It seemed, therefore, advisable that an authentic description should be published of the reasons which had led to what had been termed

A "REVOLUTION IN HOSPITAL DESIGN,"

as well as of the methods and means by which it had been accomplished. If the plan was revolutionary in its tendency, he hoped to show that it was a serious endeavour to simplify, and, if possible, to improve, hospital design. Whether it was destined to secure permanent approval, or be pointed at as an example to be avoided, depended upon, first, whether the essentials in hospital design had been properly appreciated and applied; secondly, whether those having the care and management of the institution would maintain it in efficiency. As regards the development of the design in question, distinct variations in hospital planning had been principally brought about as knowledge increased of the necessity for efficient ventilation and of the means by which it could be secured. Hence, with mechanical means at their disposal, an attempt was made at Belfast to design a hospital that could be efficiently ventilated by such means. The author acknowledged his indebtedness to Mr. William Key, of Glasgow, who had proved the possibility of securing efficient ventilation on the plenum system—the system which had been adopted at the hospital. The wards of a hospital are occupied both day and night by patients in a low state of health, and continuous change of air, with an equable temperature and freedom from draughts, secured without noise or dirt, is necessary to the cure of the patients. The question therefore is, How can hospital wards be

designed and arranged so as economically and effectively to secure the desired conditions? Reference was made to correspondence which had appeared in a contemporary, suggesting that in consequence of the proved success of plenum ventilation, combined with antiseptic treatment, it might be possible to dispense with the "pavilion" arrangement of wards, and advocating double wards divided longitudinally by dwarf partitions. This idea had seemed to the author altogether wrong, and he had set forth his views in a letter to that journal of Aug. 8, 1896. Here he suggested that, "instead of erecting detached pavilions of several stories, it might be better to spread out the wards on one story only, placed side by side and lighted by continuous lantern lights. Such an arrangement would secure greater comfort to the patients, simplify ventilation by mechanical means, and very considerably reduce corridor communication, as well as dispense with the inconvenience of staircases and lifts, thereby facilitating administration. For the accommodation of the staff there would be no objection to buildings of several stories, but with all the patients compactly arranged on one floor level their wants could be easily supplied, and other difficulties of the pavilion plan would be overcome." The letter concluded: "Only those who study what is possible with the plenum system of ventilation properly applied can realise the practicability of such an arrangement; yet by its employment I feel convinced that some such revolution in hospital planning will be accomplished, and do not doubt that in time it will be demanded, partly in consequence of the great cost of the pavilion plan, but more particularly in consequence of the excessive labour thereby involved."

THEORY TESTED BY PRACTICE.

When the author was requested to meet the Committee of the Royal Victoria Hospital, Belfast, reference was made to the suggestions contained in the above letter, and he was questioned as to the practicability of constructing a hospital such as he had proposed. On attempting to fit together, on entirely new lines, the intricate requirements of a complete hospital for 300 patients and a large staff, he began to realise the difficulties he had imposed upon himself. With the assistance of his partner, Mr. Thomas Cooper, the plan in time, however, assumed the generally symmetrical arrangement in which it now appeared in the erected building.

OPPOSITION TO THE PROPOSALS.

The author referred to the opposition raised against the scheme before it was finally sanctioned by the committee. Professor Byers, Member of Council of the British Medical Association, and honorary member of the medical staff, averred that, "when first he heard that it was proposed to place all the wards side by side without intervening open spaces, to light them principally from above, and to have no windows to open, it appeared to him so contrary to all his preconceived ideas on hospital design that he determined to oppose the carrying out of such a plan by every legitimate means, and, to enable him to do so effectually, he set about independently to study the subject in all its bearings; but, to his surprise, the more thoroughly he probed it, the more and more convinced he became that Mr. Henman was right."*

THE GENERAL DESIGN.

The cost of the buildings, including all engineering requirements and a complete steam laundry, was but a trifle over £300 per patient's bed—proof that the arrangement of plan is capable of being carried out at an economical figure. The site is six acres in extent, to which another six is to be added. The hospital stands comparatively high, has a pleasant outlook in every direction, and is readily accessible from most of the large manufactories and works, and from the poorer parts of the city, whence the majority of the patients will come. From west to east there is a fall in the level of the ground of over 20ft., of which advantage has been taken; by keeping the main floor level well above the ground adequate height is secured for the principal fresh-air duct, which runs under the main corridor, for the branch ducts conveying fresh

* Asked recently for his personal experience of the working of the hospital, Professor Byers said that the building "more than fulfilled his expectations; the plenum system worked admirably, and whether from the point of view of administration, ease and comfort of patients, or adaptability to clinical teaching, he knew no hospital equal to it."

air to the several wards and accessory rooms, also for a pipe-duct running parallel with the principal air-duct—a necessary provision, so that heat from the steam and hot-water pipes may not penetrate the buildings during the summer months, and that convenient access may be obtained to all piping. Opening directly from the hall opposite the porch entrance runs the main corridor from east to west, some 450ft. long and 9ft. wide. Branching southward are seventeen short corridors, giving access to as many wards, each with fourteen beds, with their accessory rooms, all practically under one roof. The eight wards to the east are for medical cases; then come eight wards for surgical cases, and one for gynaecological cases. To the north are two for ophthalmic cases. The author described

THE GENERAL ARRANGEMENT

of the rooms, male and female wards, classrooms, clinical rooms, operating-rooms, ward kitchens, storerooms for clothing, nurses' and cleaners' rooms, sanitary conveniences, &c.; also the "Extern," or out-patients' department, with its waiting-hall and medical, surgical, and specialists' consulting-rooms, examination-rooms, dispensary, &c. Intercepting lobbies between wards and conveniences are dispensed with. Open windows with plenum ventilation are objectionable, and without open windows intercepting lobbies are an anomaly. By a simple adjustment air from sanitary turrets is prevented from entering the wards, air-pressure in their direction being maintained from the wards outwards. To the ward kitchens no doors are provided. With plenum ventilation an equable temperature and freedom from draught are secured, consequently inner doors are required only for the sake of privacy, or where difference of temperature is desired to be maintained. Two small detached buildings at the west end of the site are for isolation purposes. They receive fresh air by a continuation of the main duct underground, and, although at least 600ft. away from the fans, are amply supplied with fresh air.

CLERESTORY LIGHTING.

The author showed sections through a portion of the ward-block to give a general idea of the method of lighting and of the construction adopted. The windows are not skylights, as generally understood, but may be more properly defined as clerestory windows, slightly sloping (at an angle of 60° to the horizon), and glazed with $\frac{1}{16}$ in. plate-glass. The result is most perfect lighting to every portion of the building. Surgeons using the operating-rooms state that nothing could be better for their purpose: the light is ample, well-diffused, and practically free from shadowing. An advantage of plenum ventilation not always appreciated is that the cubical contents of buildings may be very considerably reduced. Given sufficient floor area for nursing and teaching purposes, the height of wards need be no more than appearance demands, and when lighted as they are in this instance the cubical contents are much reduced, being not more than two-thirds of what is ordinarily required, thereby effecting a considerable saving in cost.

FITTINGS AND APPOINTMENTS.

After referring to the administrative buildings, the author described the various fittings and appointments of water-closets, sinks, bathrooms, operating-rooms, post-mortem rooms, pathological and microscope rooms. The whole of the sanitary appliances were carried out from the architect's designs by Messrs. Morrison and Ingram, and fixed by Mr. John Dowling, plumber, of Belfast. Mr. Henman concluded with

A WORD OF CAUTION

about plenum ventilation. It is essential it should be applied with full knowledge and by those competent to deal effectively with it. Distrust an engineer who will give a scheme for ventilating any building indiscriminately on the "plenum" or "extraction" system, or by what are termed natural means; but try to realise that every building should be designed for the particular method of ventilation intended to be employed, and that the means for procuring ventilation must be specially designed on scientific principles to meet the actual requirements of the building.

THE ENGINEERING WORK OF THE BELFAST HOSPITAL.

Mr. HENRY LEA, M.Inst.C.E., who followed with a paper on this portion of the subject, also illustrated by many lantern slides, speaking of the ventilation, said that the design which

Mr. Henman had originated facilitated to an extraordinary degree a simple arrangement of air-ducts of ample proportions. To emphasise the importance of this point, he mentioned two large buildings now ventilated by mechanical means, each requiring about 13 million cubic feet of fresh air to be driven through them per hour. In one building, owing to the liberality with which the air-ducts are proportioned, the total amount of power required to drive the fans was 191 H.P.; in the other building, owing to the air-ducts being restricted and very crooked, the power required was 531 H.P. Putting this into money value, in one case the electrical driving-power cost £766 per annum, and in the other £2,164 per annum. The main air-duct at the Belfast Hospital, at the end nearest to the fan chambers, has a height of 20ft. and a width of 9ft. The full width is preserved to the far end of the wards block, a distance of 443ft.; but the bottom slopes upwards, so that the height is diminished to 6ft. at the far end. The total cubical capacity of the hospital buildings ventilated on the plenum system is 703,003 cu. ft. With seven changes of atmosphere per hour in the winter the velocity of the air entering the main duct is 7.06ft. per second, and with ten changes per hour in the summer, the velocity is 10.85ft. per second. The proportions of the branch ducts and of the vertical air-flues are based upon similar liberal lines, as are also the air-ways through the fan chambers and the water-screens. This accounts for the reduction of power for working the system. Another point in relation to economical working is that the fans are driven by a steam-engine, the exhaust steam from which is utilised for heating the water for the baths and lavatories. The lecturer showed that there was a saving under this head of £275 per annum.

HOT AND COLD WATER SUPPLY.

The main engineering features in connection with the ventilation of the hospital having been fully detailed, the lecturer treated of the arrangements for hot and cold water supply. The supply of cold water is brought from the cold water cistern in the roof of the east wing, and is connected to the return pipe, so that the cold water, after passing through the rotary pump, enters and is heated by the two steam calorifiers before it passes to the various portions of the building. The general arrangement of the hot-water circulation, which was described in considerable detail, includes two hot-water cylinders, each containing 900 gallons of water. To the system of circulation are connected eight subsidiary circulations under the ward block, for the purpose of supplying the baths and lavatories in that block. Other subsidiary circulations are also provided for the ophthalmic block, the extern, and the administrative block. All the hot-water mains and the branch circulations are covered with non-conducting composition. The effect of the rotary pump is such that the hot water is caused to circulate through the whole system about once every fifteen minutes, which insures evenness of temperature. The system of cold-water pipes follows substantially the course of the hot-water pipes, with the exception that no circulation arrangements are provided. Wherever the cold-water mains and pipes are exposed to cold air they are covered with non-conducting composition to protect them from frost. In each of the operating-rooms is an apparatus for sterilising water for surgical purposes. The water for these purposes is first warmed by means of a steam coil, and is then passed through a Berkefeld filter, which frees it from every kind of microbe, and is thereby rendered innocuous for surgical use. The temperature is regulated with the greatest facility.

THE LAUNDRY

is designed so that the articles to be cleansed go through the consecutive stages of treatment without being carried over the same ground twice. The ordinary type of machinery is employed. The exhaust steam from the laundry engine is used to heat the drying closet and water for the washhouse. A fan draws air from the ironing-room, forces it through the heating coils of the drying closet, and thence into the washhouse, upon the steamy atmosphere of which it has a beneficial effect.

ELECTRICITY FOR LIGHTING

is supplied from the two mains. The system of wiring is that which is now well known and generally used, but which the author believes he was the first to use—namely, placing a suitable

number of fuse-boxes about the building; using the same sized sub-mains throughout for supplying the fuse-boxes; using the same sized fuses in all the fuse-boxes; placing not more than five 60-watt lamps on each fuse for 100 volts, or eight lamps on each fuse for 220 volts; and using the same sized lamp leads throughout the whole building. The total number of 16c.p. lamps, or the equivalent, installed in the establishment is about 1,100.

Sir JOHN C. HOLDER, BART., Chairman of the Committee of the Birmingham General Hospital, at the call of the President, proposed a vote of thanks to Messrs. Henman and Lea. When, he said, it was decided to rebuild the hospital in Birmingham, a competition was instituted, and on the recommendation of Mr. Alfred Waterhouse, the assessor, the design sent in by Mr. Henman was adopted. Its author was appointed architect, and had carried out the undertaking most satisfactorily, not a single drawing in the actual work having to be altered or amended after it had once been submitted to the committee. As originally designed, the institution was intended to be ventilated by a natural system; but the speaker received letters from friends asking him to examine into the merits of the plenum method. Eventually he went to Glasgow to see the system in operation, and was so impressed by it that he persuaded the members of his committee to accompany him on a second visit, with the result that they were even more pleased with its working than he had been. He and his friends went over some Board schools in Glasgow, in a poor district and on a wet, muggy day, and could perceive in the rooms no smell of wet clothes, while the teachers and head-masters spoke highly of the system. They thereupon decided to adopt Key's plenum method for their new hospital, and the committee were very pleased with its operation. In the coldest weather the internal temperature stood at 59°, and in the height of summer it had never risen beyond from 68° to 69° Fahr., while there seemed to be a constant supply of fresh air alike to patients and nurses. Another point was that when the infection of measles and of scarlet fever had been accidentally introduced—a trouble to which general hospitals were very liable—they had not proved contagious, and the disease was isolated without further trouble. When in the United States and Canada he had inspected the famous Johns Hopkins Hospital at Baltimore—which now proves far behind the time—the McGill University Hospital at Montreal, and the Presbyterian hospital at New York; but none of these institutions were equal to the one at Birmingham, which was spoken highly of by the late Sir William McCormack. He might explain that the Birmingham Hospital was on the pavilion plan, and had been ventilated on the plenum system, from plans by Messrs. Henman and Lea. The cost of upkeep had been reduced to a minimum, that of working the fans, &c., being only £600 a year. The Belfast scheme was a later and very bold one, the special points to his mind being the method of keeping all the wards close together, and with the lowest possible walls.

DR. CHRISTOPHER CHILDS seconded the vote of thanks to the lecturers. He was strongly convinced that for many purposes the plenum system was the best method of ventilation; but he should have liked to have had more detailed particulars as to the actual dimensions of the inlets and outlets adopted at Belfast. In many plenum installations he had inspected, there had seemed to him grave defects in the relative positions and sizes of the inlets and outlets, and it seemed to him that no definite principles had been laid down as to the most important details. He was sorry, having said that much, to strike a discordant note, but he was not sure that it afforded sufficient fresh air for hospitals and schools. They all recognised the necessity for a full supply of pure air. It was easy to test the atmosphere and ascertain the relative proportion of carbonic-acid gas in a volume of air, and also to count the microbes; but hitherto analysts had failed at one point—in showing them whence came the invigorating qualities which they all recognised as present in fresh air. These health-giving qualities seemed to him to be lacking in air pumped into a building under a plenum system, and to be present in methods of natural ventilation. The value of fresh, not filtered or pumped, air was obvious in the treatment of cases of phthisis, and all recognised its exhilarating effects—

Mr. HENMAN, interrupting with great warmth,

said the speaker clearly did not know anything about the subject. (Cries of "No, no.") They were there to discuss the application of a plenum system to a particular building, and how far it had been successful, as to which this gentleman knew nothing, and not to talk of the general question of fresh air. He protested, at that late hour, of the time being so taken up with other matters.

The PRESIDENT said Dr. Childs was perfectly in order and to the point, and would he please continue?

Dr. CHILDS added that he was a strong advocate of the plenum system for certain purposes; but he would not allow that it was the best for hospitals, as patients needed the stimulus of absolutely fresh and frequently changed air.

Mr. ALFRED SAXON SNELL asked whether the council would arrange for a second evening to be devoted to discussing this extremely important question. The system that had been advocated that evening had the attraction that attached to something novel; but he and others believed it to be, so far as they had investigated it, a huge mistake. He moved the adjournment of the discussion.

Mr. H. T. HARE, P.A.A., seconded the motion for adjournment.

The PRESIDENT said they had all been deeply interested in the novel suggestions for hospital construction brought forward in the papers read. If the Council could arrange it, they would allot a second evening to discussing so important a question; but there were great difficulties in the way, not only in providing the time, but in getting such an audience together again. They had been extremely interested in hearing of the manner in which the difficulties presented by the Belfast hospital had been overcome. The idea of packing all the patients together on one floor and under one low roof was novel, and there were obviously enormous advantages to the staff, provided that the plenum system allowed, as Dr. Childs had suggested, a sufficient supply of fresh air. The advantage of a plenum system was that it was possible to regulate the amount of air passing into and out of a room. Whether there were greater disadvantages to counterbalance this could only be ascertained when the question was threshed out in discussion, and he hoped it would be possible for the Council to arrange another meeting in order that they might hear both sides. The President put the vote of thanks, remarking that they were under exceptional obligations to Messrs. Henman and Lea for having brought forward and explained so novel a system of construction.

Mr. HENMAN, in reply, said it was clear Dr. Childs had never properly investigated the plenum system in actual operation. If Dr. Childs were to go into a well arranged hospital ventilated by this method either by day or by night, he would find the atmosphere equally pure, whereas when the speaker had inquired of nurses in institutions ventilated on the natural system of the conditions of the air during the night, they admitted that it was not fresh, as the ventilators were never kept open, and in one case he was frankly informed that at night the air of the wards was stinking. Since, under the plenum system as carried out by him, the air in a hospital was changed seven times per hour in winter and ten times per hour in summer, the atmosphere must be better, it stood to reason, than where natural ventilation was relied upon, under which the air was only changed three times per hour.

Mr. LEA also replied briefly, and offered to attend an adjourned meeting whenever arranged, and give the details of construction that had been asked for.

THE REGISTRATION QUESTION.

The PRESIDENT announced that the next assembly of the Institute would be on Monday, January 4, and would be a business meeting of members only, to discuss a memorial which the Council had received, duly signed by Messrs. G. A. T. Middleton, Butler Wilson, J. W. Beaumont, John Woolfall, Edgar G. C. Down, and H. Davis, in which they state that they propose to bring forward the following motions, viz.:—

1. That this Institute is in favour of the general principle of the Compulsory Examination and Registration of Architects.

2. That a Committee be appointed to consider what steps should be taken to give effect to this principle, and to report thereon to a special general meeting before the opening of Parliament.

3. To nominate this Committee.

The PRESIDENT added that he trusted that

those who were interested in the question, both for and against, would attend, that they might hear both sides fully discussed.

ROYAL ACADEMY SCHOOLS.

THE prizes awarded to the successful students of the Royal Academy Schools were distributed at Burlington House on Thursday evening in last week. In the absence, through indisposition, of the President, Sir E. J. Poynter, the distribution was made by Mr. Ernest Crofts, R.A., Keeper of the Academy, and there were present most of the Academicians and Associates, together with a large number of the relations and friends of the students. The following is the prize list: Historical painting (the meeting of Diogenes the Cynic and Alexander at Corinth, *cf.* Plutarch, Alex. c. 14), gold medal and travelling studentship (£200), not awarded. Landscape painting (an express train at sunset), Turner gold medal and scholarship (£50), John Hodgson Lobley. Land cape painting (a bank of ferns or bracken), Creswick prize (£30), Walter Percy Day. Painting of a figure from the life (open to male students only), silver medal, 1st, William Charles Penn; silver medal, 2nd, William E. Gladstone Solomon (disqualified owing to having received the same prize before). Painting of a head from the life, silver medal, 1st, Walter Percy Day; silver medal, 2nd, John Holman Wybrandts. Painting of a draped figure (open to female students only), silver medal, 1st, Catherine Oulless; silver medal, 2nd, Marjory Violet Watherston. Cartoon of a draped figure, silver medal and prize (£25), William E. Gladstone Solomon. Design in monochrome for a figure picture (Elijah Cursing Ahab and Jezebel in the Vineyard of Naboth, 1 Kings, chap. xxi.), Armitage prize, 1st (£30) and bronze medal, not awarded; Armitage prize and bronze medal, 2nd (£10), not awarded. Design for the decoration of a portion of a public building, prize (£40), Lilian Price Edwards: *proximo accessit*, Walter E. Webster. Set of six drawings of a figure from the life (open to male students only), 1st prize (£50) and silver medal, William E. Gladstone Solomon; 2nd prize (£25), William Charles Penn; 3rd prize (£15), Thomas Dargan Philpot; 4th prize (£10), William George Simmonds (disqualified owing to having received the same prize before). Drawing of a head from the life, silver medal, 1st, not awarded; silver medal, 2nd, Francis E. D. W. Fitzjohn Crisp. Drawing of a statue or group, silver medal, 1st, not awarded; silver medal, 2nd, not awarded. Perspective drawing in outline (open to painters and sculptors only) (Mr. Willoughby's temple in Sir William Chambers's "Architecture"), silver medal, no competition. Composition in sculpture (three generations), gold medal and travelling studentship (£200), Arthur Charles White. Model of a design (David cutting off Goliath's head, 1 Sam. chap. xvii. verse 51), 1st prize (£30), Leonard Jennings; 2nd prize (£10), Frederick Brooke Hitch (disqualified owing to having received the same prize before). Set of four models from the life (open to male students only), 1st prize (£50) and silver medal, Frank Ransom; 2nd prize (£20), George Gilbert Walker. Design for a medal (to commemorate the Durbar, with an allegorical figure of India on the obverse), silver medal, Henry William Page. Model of a bust from the life (open to female students only), silver medal, 1st, no competition; silver medal, 2nd, no competition. Model of a statue or group, silver medal, 1st, Louis Fritz von Roselieb; silver medal, 2nd, not awarded. Design in architecture (a domed church), gold medal and travelling studentship (£200), Lionel Upperton Grace. Set of architectural drawings (the interior of St. James's Church, Piccadilly), silver medal, 1st, Leslie Wilkinson; silver medal, 2nd, James de Caynoth Ballardie. Set of architectural designs (upper school), prize (£25), William Edward Brooks. Set of drawings of an architectural design (lower school), prize (£10), George Forsyth. Plan of a building (a general hospital), prize (£10) not awarded. Original composition in ornament, silver medal, no competition. Perspective drawing in outline (open to architects only) (interior of the hall at Eltham Palace, Kent, looking eastward), silver medal, Percy Ion Elton. The Landseer scholarships in painting and sculpture, of £40 a year each, tenable for two years, have been awarded—in painting, to Walter Percy Day and Ernest Stafford Carlross; in sculpture, to Frederic Charles

Chrisfield. The galleries containing the competition works were open to the public on Friday and Saturday last.

The Secretary (Mr. Fred A. Eaton) read the President's address, in the course of which Sir Edward Poynter said that the Royal Academy had recently made some very considerable and important changes, which should have a very far-reaching effect, in the conditions under which admission was granted to those schools, and in the course of study which they and future students would pursue while there. It was thought by many members of the Royal Academy that much was taught there with which candidates for admission should be conversant before entering the schools, and that by omitting the more elementary stages of instruction subjects of study could be introduced for which there had not hitherto been sufficient time or opportunity, and after long and serious consideration, extending over some two years, the Academy had formulated the system of study which was embodied in the new regulations, and which came into working for the first time at the beginning of the present term. The changes made were in some respects so sweeping that some little time might be required to get the system into working order, and it was conceivable that some modifications in the direction of a return towards former arrangements might be found desirable. Much would depend on what capacity schools in which candidates received their preliminary instruction might develop towards meeting their requirements. The most valuable effect of this change, if the higher standard for admission which was demanded under the new rules was properly insisted on, ought to be in raising the quality of instruction in other schools of art.

ARCHITECTURAL ASSOCIATION CAMERA AND CYCLING CLUB.

ON December 9, 1903, before a large attendance, Mr. E. J. Steadman, of the Lumière N.A. Co., Ltd., gave a demonstration of colour photography, dealing first with the theory of the subject and the colours of the spectrum. He then described the process advocated by the Lumière Co., in which three negatives are taken, the first through a blue screen on an ordinary plate, and the others through red and green screens respectively on specially prepared plates which are sensitive to these colours. These negatives are printed on a bichromated gelatine emulsion spread on celluloid or talc, giving a barely visible image, which is developed in hot water and fixed in hypo in the usual way, leaving a clear film with almost invisible image. The film is then dried and dyed in a complementary dye; that is, the print from the negative taken through the blue screen is dyed green, that through the red screen blue, and that through the green screen red. These prints are then superimposed and the dyes adjusted, the blue print being taken as the basis, and the other dyes either intensified by further dyeing or reduced by washing until a perfect transparency in natural colours is obtained. For prints a thin flat bromide print is made from the negative taken through the red screen and toned with iron to a blue tint. Dyed positives on a stripping film are then made from the other negatives and squeezed one at a time, the blue print dried and the talc support stripped, the result being a paper print in natural colours. The exposure required for the three negatives is—through the blue screen four times the ordinary exposure, through the green screen six times, and through the red from eight to ten times. A white object should be in the picture as a guide when developing, because its density will be the same in all three negatives, and the negative taken through the blue screen should be taken as the standard for density when developing, as it is least sensitive to the ruby light of the dark room. Prints showing the various dyes and the combined result were then handed round and discussed. Mr. Steadman composed two prints from their separate parts during the discussion, to show the ease with which the superimposition was made. The lights were then turned down, and a short demonstration of the theory of colour was given by means of the lantern, after which a remarkable series of photographs of landscapes, fruit, still life, and architecture was shown, which had been prepared in natural colour by the Lumière Co.

Mr. Louis Ambler, in proposing a vote of thanks to Mr. Steadman, referred to the crudeness of colour and lack of atmosphere in the

photographs of landscapes shown, and was informed that this was at present unavoidable, but, very curiously, was only found in landscape work. Mr. Stenhold, in seconding the vote of thanks, suggested the use of the process in photographing stained glass and other coloured decorations in buildings.

Mr. Wonnacott put the vote of thanks to the meeting, and gave a brief *résumé* of the history of colour photography, afterwards inviting the members of the Camera Club to be present as his guests at Sir William Abney's lecture on "Colour Photography" at the Royal Photographic Society on Dec. 14.

After Mr. Steadman's reply the meeting terminated, fully impressed with the practical value of the Lumière Co.'s process.

TOWN SUBWAYS.*

By R. M. PARKINSON.

(Concluded from page 790.)

METHOD OF CONSTRUCTION.

THE walls have been shown as of concrete, because, owing to the cheapness of ballast and cement in London, this is the best material to use there, but brickwork with brindle facing, in damp situations, would be better in many places. The side walls should be first put in, trenches of their exact width being excavated and filled in with concrete, and no attempt should be made to give a smooth face. Trenches should then be cut across the road for setting the girders, and these latter should be covered over with packing-blocks 9in. deep, on which two thicknesses of $\frac{1}{4}$ in. planks should be laid, the planks in the second layer to take the traffic being parallel to the girders. The 9in. packing-blocks are provided to enable the planking to be laid quite clear of the road metal, which can be removed from between the girders to put in the concrete arches without trouble. After the girders and temporary flooring-boards have been fixed the ground below may be removed for a depth of 6ft. or 7ft., at which level, 12in. by 12in. timbers should be put across from wall to wall 12ft. apart to keep all secure till the invert has been put in. The concrete arches can be constructed from below without removing the temporary flooring; but it is necessary to close half the street for the laying of the flooring blocks. It would be simpler to refill the road metal over the girders along one side of the street and close the other, form the concrete arch on the earth as a centre, and then do the paving and reopen; but some time must be allowed for the concrete to set, and so the street would be blocked for a much longer period than is required for laying the paving alone; also as the work would have to be done from the top, the streets would be more blocked by the extra traffic, whereas if done from below, the earth would be taken right away and the concrete materials brought up from the tunnel. The old pipes would have to be slung or strutted up until they could be diverted. For the first length undertaken new pipes would have to be provided, and the old ones utilised for the second length, and so on, temporary connections being made where necessary. Should any old pipes come within 2ft. of the surface, the girders must be packed up over them temporarily, and afterwards lowered down to their right level, and if they come even higher, 12in. by 12in. timbers must be used in place of girders temporarily. During construction the subway will be so full of old and new pipes running in every direction that only small 2ft. gauge waggons will be able to be used. These can, however, tip into large waggons in the finished part of the subway, the permanent tramway being laid in for this purpose as soon as possible.

ESTIMATES.

The estimates given below have been prepared on the following basis:—The excavation, including timbering and a moderate amount of pumping, has been put at 4s. per cubic yard, except in Schemes 2 and 5, where it has been put at 2s. and 3s. respectively. The removal of the surplus is put at 2s. 3d. per load, or 3s. per cubic yard, in all cases. The 8 to 1 concrete price has been obtained thus:—

* Prize Essay on the Prevention of the Breaking Up of the Streets during the Laying of Water and other Pipes and Conduits, for the Worshipful Company of Paviers.

1 ton of cement, including bags, carting, and storing, at 31s. 6d.	4 6
1 1/2 yard ballast, including carting, at 6s.	7 6
Labour	2 6
Plant, supervision, and contingencies	3 6
	18 0

The prices for the paving, kerbing, and the gas and water pipes are for labour and cement or lead, as the case may be, only. The prices for the pipes are made up as follows:—

	6in.	9in.	12in.	15in.
Earthenware pipes	0 9	1 9	3 0	5 2
Cement, sand, and yarn	0 0 3/4	0 1 1/4	0 2	0 2 1/2
Labour	0 3 1/2	0 4	0 5	0 6
Contingencies, &c.	0 1 1/2	0 3 1/2	0 5	0 5 1/2
Total	1 3	2 6	4 0	6 4
Internal diameter	4in.	6in.	15in.	18in.
Lead and yarn	0 5	0 7	1 4	1 8
Labour	0 4	0 6	1 6	2 0
Contingencies, &c.	0 3	0 5	0 8	0 10
Total	1 0	1 6	3 6	4 6
Internal diameter	2 1/2in.	2 1/2in.	2 1/2in.	3 1/2in.
Lead and yarn	2 2	2 8	3 4	5 0
Labour	2 6	3 3	4 0	6 0
Contingencies, &c.	1 0	1 4	1 8	2 0
	5 8	7 3	9 0	13 0

The tramway may be estimated thus per lineal yard:—

16in. gauge with 6lb. sleepers	2 6
18in. " " 7lb. "	2 7
24in. " " 10lb. "	2 9

The price in schemes 6, 7, and 8 is obtained thus:—

1 cwt. nails, at 6s.	6 0
4lb. fishplates and bolts, at 1d.	0 4
12lb. fancy bolts and straps, at 1 1/2d.	1 6
3 feet cube creosoted timber, at 2s. 4d.	7 0
1 yard lineal labour in laying	0 8
Total	15 6

SUMMARY.		£ s. d.
Fig. 3	5 10 0
Fig. 4	2 10 0
Total amount of estimate	£8 0 0

In this scheme the cost of boring for the house connections is saved. The 3in. boring, including tubes, will cost 8s. per foot, and the 4in. about 10s.

CONCLUSION.

The writer has described eight schemes, and given a careful estimate of the cost of each, and it is natural that his views as to which is the best of these should form the ending to this paper. Further consideration has, however, only confirmed the views he expressed in the preface—viz., that no general rules can be given. It is true that, all else being equal, scheme 3, Fig. 5, gives a better result for the money than schemes 1 and 4, Figs. 1 and 6, and that No. 2, Figs. 3 and 4 is, on the same premises, the best system, if the sewers are not to be dealt with. Schemes 6, 7, and 8, Figs. 8 to 11, cannot be compared with the rest as to cost. No 7, Fig. 11, provides far more for the money than any of the others, the slight inconvenience caused by the up and down tramlines being put in different streets being compensated for by the saving in expense. The supplementary estimates to the last three schemes are so put that these estimates may be on equal terms with the others. A celebrated artist once explained that his success as a painter arose from his following the rule "First know what you want to do, and then do it." So here, before anything can be done, it is necessary for careful plans to be made to show what is wanted.

REINFORCED CONCRETE CHIMNEYS.

CONCRETE and steel have been employed of recent years in the construction of lofty chimney-stacks, instead of masonry, and with decided advantages, as being more rigid, taking up less room, and saving costly materials and scaffolding. One of these built for a new power station for the Pacific Electric Railway Company at Los Angeles, Cal., last year, is noticeable for the combined use of these materials, and for the economy of its construction, the particulars of which we gave some time ago. The chimney was 180ft. in height above the base, and its exterior diameter above the base is 15ft. 2in., and the inner diameter 11ft. The base up to shoulder from the footings is 51ft. in height. The shaft consists of two concentric walls, separated by an air space or cavity of 11in. to 16in., increasing towards the top. The outer shell above the shoulder is 9in., 6in., and 5in. thick respectively up to cap in

GROUND FLOOR PLAN

FIRST FLOOR PLAN

WATERLOO RESIDENTIAL HOTEL, JERMYN STREET, W.

sections of equal height, and the inner shell is 5in., 4½in., and 4in. respectively in corresponding sections of height. The Ransome system of construction was adopted with cold twisted steel bars in each shell. There are also rings of steel bars at intervals, and in the outer and inner shells every 18in. apart or more, with vertical bars about 1ft. apart in the lower third of the stack, and at less frequent intervals in the middle and upper sections of the outer shell. The inner shell has also bars about 3ft. apart, and of smaller section. The cap is also of concrete, moulded as a capital in several hollow blocks, reinforced with expanded metal; these blocks were hoisted into position. This hollow capital is formed with cross partitions, reinforced by twisted steel rods. Many other chimneys of reinforced concrete have been constructed having similar features. In this stack the outer and inner shells are connected by ribs at intervals so that they materially sustain each other. These ribs are placed about 30in. apart, and steady the chimney in case of oscilla-

tion. We are not aware of any similar construction in this country, though concrete is being largely used for the purpose.

WATERLOO HOTEL, JERMYN STREET.

THIS building is about to be erected on the site of a fine old house of historical interest which was added to and used in later years as a hotel, and the purpose of the new building is somewhat similar. The whole of the front is proposed to be stone faced, and Westmoreland slates will be used for the roof. The six upper floors are arranged for bachelors' chambers on a plan combining bed and sitting room, whilst on the ground floor there will be two shops and a large restaurant. Each story of the building is to be set back above the second floor, so as to render the suites light and airy; by this method ample balconies are afforded, forming convenient lounge spaces and a reliable means of escape in the event of fire. The con-

tractors are Messrs. Perry and Co., who will carry out the work under the direction of the architect, Mr. G. D. Martin, of Pall Mall East, S.W.

"BUILDING NEWS" DESIGNING CLUB.

A SOLICITOR'S COUNTRY HOUSE.

WE illustrate the three designs for this subject, which we have chosen as the best out of the ninety-two plans received. Architecturally, we prefer the elevations of the third design; but the plans gave us no choice. Beyond the ordinary requirements and amenities of management of an ordinary middle-class house of moderate size, as specified, the main factor in the plan of this building consists in the location of the business-room considered in reference chiefly to the entrance, and, of course, with regard to the privacy of the other parts of the residence. A solicitor, at times, in the ordinary course of his practice, would have callers at his

house, probably of an evening, and the remainder of the premises should not be too evident to such visitors, and yet at the same time this occasional provision ought to be so contrived as not to spoil the adaptability of the entrance-hall for everyday uses. At the end of this review we reprint the conditions issued for the guidance of competitors.

"Ionic" is first, "Tauqs" second, and "Ghost" third.

The plan chosen for the premier position has an excellent hall for the particular purpose, the bay affording a convenient spot for the client or caller to wait should the solicitor be engaged in his room at the moment, or should it not be exactly desirable for the servant to show the visitor into the study without inquiry. It hardly seems necessary to elaborate this matter, as anyone can grasp the position, though, as a matter of fact, no one else in the competition has quite so nicely realised it as "Ionic." The study itself is a comfortably set-out room. The corridor is well lighted, and would give a sense of size and interest. The staircase is well out of sight. The "nook" out of staircase-hall is not wanted, and a door leading through from the parlour to the garden way would have been very much better. The angle to the drawing-room is itself a doubtful advantage. The fireplace recessed under the stairs, and so throwing all available space into the parlour, appears to us would have been a preferable arrangement. The canted landing is a crude detail upstairs, which might be improved; but the bedrooms are good, with the exception that the dressing-room has no access excepting through the bedroom. The elevations speak for themselves and look suitable. Even if we do speak in this qualified way about them, the design needs no apology in this respect.

"Tauqs" takes his position as second also, mainly on the score of the plan; though it is not so good as the first. The library is located near the entrance; but it is not one of the most convenient apartments, with a draught on to the chimney corner. The hall serves no particular object save to give a door on the private side of the drawing-room. A mere recess would have done that, and the hall-space might have been thrown into the drawing-room, which again could be brought further in. The long through passage is written on diversely "Entrance," "Staircase," and "Servery," all of which designations may be correct; but, all the same, it is a long and somewhat dark passageway. The first floor is rather good, though we should prefer to have seen the w.c. door in both these designs a trifle less in evidence. We need not go into the merits of the elevations; they are not particularly attractive, and we do not put them forward for imitation, but their scheme is all of a piece, and has been well thought out. What is wanted is a greater appreciation of wall space, and the interest which belongs to contrast, avoiding an all-over-the-same effect, and leaving some one feature to emphasise the design. "Tauqs" is not over-elaborate, and is not given to fussy detail, but another time we shall hope he will impart a touch of personality and spirit to his design.

"Ghost," the third design, pleases us by the simplicity and breadth of the exterior of his building, though the chimneys might have been handled with more regard to the desirability of some one dominating portion in the grouping of the composition as a whole, and with this idea we should have been inclined to make more of the stack rising over the dining-room. Perhaps there is hardly sufficient justification for canting the right-hand wing of the building; and the library, as a place for housing books, is not the best shape treated as an octagon. Its position for business purposes is most objectionable between the staircase and the drawing-room. The dining-room is not well planned with all the windows at one end, and no exact place for the sideboard, unless it occupies the long wall facing the fireplace, where space can least be spared. Its door facing the entrance is not a model arrangement. The kitchen wing is neatly isolated, but the window to the kitchen under the eaves is very low down. The best bedroom is large, but the position of the bed at the door end necessitates the light being in front of the users; otherwise, if put facing the fireplace, the occupants must sleep in a draught. The corridor space on this floor, including both stairs as a total superficial area, is in excess proportionately with the rooms provided. There is

too much incongruity between the big bedroom and the small one adjoining. "Eurymedon" gives an old-world look to his house, which is quiet and in good taste. The S.W. end is quaintly picturesque. The plans are too crude and the passages ugly, while the head room in the porch is very low under the stairs, even allowing a step down from vestibule. The library is entered conveniently from this lobby, but the broken divisional wall between the drawing-room and the library is bad. The central corridor is too dark. This design with more study expended on its interior would have been a success. "New Boy" is careless in arranging his elevations and plans on the sheet, so spoiling his chances of illustration. Let all the competitors take a note of this remark. "New Boy" has a sense of picturesqueness, and the detail of front entrance exhibits a taste for good domestic work on old lines. His drawings are lacking in effectiveness. By showing such scraps of roof tiling (a roof never looks thus), a trick is attempted which spoils all appreciation of repose—a quality which the "New Boy" has really rather well obtained in an otherwise unpretentious fashion. His plan is not so good, because there is no recognition of proportion about it. Thus, if one takes the super. of his porch, vestibule, hall, and staircase hall beyond, the area is considerable, and yet planned thus the whole thing is cramped. The silly garden entrance dovetailed thus awkwardly into the two best sitting-rooms spoils the shape of both. The library is fairly handy to the front door; but there is no room for the caller to wait in till he is shown into that apartment. We do not think we need go through the plan further—space precludes; but the w.c. for the servants is too much in evidence next the tradesmen's doorway. "Alpha" wastes room in halls and landings, and has a dark passage in the middle of his house. The inner hall has an ungainly shape. The business room is close to the front door, and the outside hall gives a nice waiting space. The west elevation has the windows so contrived as to destroy the structural strength of the wall. The chimney stacks are ugly, with cornices projecting so excessively, and "Alpha" does not realise the charm of proportion. "An Old Scholar" has not finished his lessons yet. He omits all rainwater pipes, and does not show how he would locate them on the garden front, where there are three gables with a big arch to the entrance, and a window placed in a line with the valley above. The dome over the main entrance is too squat to be seen behind the parapet, while the head of the window below is too high up to allow of a proper gutter, even if the diameter of the dome did not extend too far, as it does, to allow of a proper parapet wall. The hall through the house depends on a borrowed light from the garden way, which is only got at through the best parlours. "Old Scholar" ought to do better. "Yew Tree" adopts half-timber, with neat drawings, careful and business-like; but his roofs are so small and his ground-floor windows are so big. The staircase is in full view of the front door, and to reach the library the hall has to be traversed. Much space is wasted in a landing and upper hall, and there is an ill-contrived dark passage in the centre of things on the ground floor. "Ilex" is a good, quiet draughtsman; but he has a trick of locating the doors to his principal rooms too much in the corners, and without reference to the position of the fireplaces. Thus, in the library, which is correctly enough near the main entrance, the door opens right on to the fireplace, which is almost in full view of the external portal, so that, should the solicitor chance to be warming his toes when some casual client called, the latter would see too much at a glance, and, besides, there is no convenient place for the caller to wait in other than the hall in the middle of the house. There is no object in shutting off the stairs from such a hall. The plan, otherwise, is a fairly good one, though we do not commend the corridors on first floor, and think the landing occupies a lot of space. Externally the design is becoming, but not attractive. "Liver" has more idea of composition, and his entrance-front is nicely grouped and composed, with bay windows at the ends and a row of dormer gables in the centre. The one odd chimney is out of place, but might have been managed in a less timid way, or, better still, omitted, by shifting the bedroom and library fireplaces. As to the hall fireplace, that apartment is so ill-contrived, owing to the cross-passage, that an entirely different arrangement would be desirable. Every visitor going to the business-room would have to pass the parlour doors. "Liver's" other

elevations are very ordinary. "Marksman" gives a cottage-like look to his house, and in some respects he is successful. His plans are among the best sent in, though not compact in their arrangement. The library is near the entrance, but the fireplace is right on to the door of the room. The drawing and dining rooms are square formed and comfortable, but are not artistically contrived; they do avoid the curse of "quaintness," which is a merit. Not so "Cedric," who seeks to find favour by canting off in a somewhat meaningless way his library and entrance porch, only to create a few difficulties which have floored his ambition. The library is odd-shaped and uncomfortable, with a most awkward fireside away from the light and close up to the door which opens right on to it. The seat in the dining-room bay is of the upholsterer's "fitment" type, and not very good at that, with lancet-headed cupboards or screens at the back of the seats. The first floor is compact, and the elevations look wanting in breadth, though not badly drawn.

"Force" was very late, but for once we accept his excuse. If he had spent less time in inking over almost the entire surface of his elevations, they would have been better-looking. He over-joins them, and yet shows the same house in the view with no joints at all, or hardly any, making it look as if it were rough-cast. The staircase is too much in view of the entrance. The dining-room is an ugly shaped one, and we are not charmed with the chamber floor. The loggia does not add to the elegance of the composition.

"Cave Canem," of the Dutch cheese tree and shrub school, curls up the coping of his front gable, Chinese fashion, and puts balls on the inverts of the curve. His plan has merit, however, but the screened off landing is objectless, and the business-room is too mixed up with the parlours. It is not quite an ideal design. "The Magpie" comes here, because he does give a vestibule door to the business-room; but, then, all the same, both the parlour doors are close at hand, only just beyond the open screen. The passage to garden door is ugly, and the drawing-room fireplace is not redeemed by the projecting screen to keep the draught away from the door. The massive archway to porch is spoiled by the quoin supporting the wall above coming in so close, and the proportion of the surrounding gables is ungainly and ill-managed. The style has a casual look about it, the roofing slabs being drawn like random rusticated masonry, with wide joints all round as if there was no lap. "Gayville" would appear to be a man of taste if we judge by some parts of his work; but he is distinctly weak in doorways: the front entrance is very ugly, and the drawing-room garden door, with its Tudor head, is no better—like the waiting-room entrance to a Gothic railway station done by the locomotive engineer. Otherwise the S.E. elevation is well composed and pretty, with the drawing-room bay quietly tucked in by the side of the projecting chimney breast. The plan is open to objections already enumerated in respect to position of the doors to the parlours and business-room. "Orchid" gives a "double-fronted villa" look to the garden elevation of his house, and the gable over the main entrance has a pinched appearance. The hall and passage area is large and devoid of good effect without dignity of contrivance. The business-room is well positioned, but the house seems to have all its thick walling outside and only thin partitions within. "Old Mercer" gives a squarish building with a central hall and good spacious rooms. The business-room is an ideal arrangement, with the fireplace close to the window, though the legal gentleman would have to sit too near the fire to get the full advantage of the window. The big, sprawling oriel outside accounts for this position of the business-room light. The exterior is unattractive, and the angle set porch is paltry. "The Last Man In" concludes the elect set whence the three first designs were chosen. We are not sure he deserves to be so favoured, but the margin line is very fine, and those contributors who come next must not think they are out of the running. With such a heap of plans they cannot be all mentioned at once, and space is inadequate to speak of them all. The business-room in this plan is reached out of a tiny lobby, which also furnishes the only entrance to the drawing-room. The elevations are not good; but on the whole, taking one thing with the other, the author obtains an opportunity for criticism. He has much to learn still.

"Tyne" would have been placed much higher

but he ignored the rules as to size of paper, and so must suffer for it. Another time he will be placed *hors de combat* at once. The garden front is good; but the entrance front porch has a wavy-lined parapet which is paltry. The plans are among the best sent in, and the view is boldly drawn, but not effectively, with the blacked solid trees. The plans are impaired by running the lines like Oxford-frame corners at all the door and window openings. Drop such fakements, "Tyne," in future. "O. B." has merits, which we give him credit for, and he suffers from ineffective draughtsmanship and detail. His house would withstand the four winds of heaven in its granite-like masonry. "The Kid" draws free-hand with a thick, heavy line. His plans are of the "quaint" type, all angles and oddments, with occasional seats all about for people to squat on as they go to and fro. "Lyric" has a better set of elevations than plans, but they are made to read two ways on the sheet. "Vectis" draws with horizontal lines only, so that the building has the appearance of being weather-boarded. The contrivance of his plan looks cramped, and the entrance certainly is so. "Blackheart" comes next. Good hall, wasteful landing. Neat drawing, but shows ordinary stone sort of building. "Pip" tries to get distinction in his garden front; but it lacks the repose so desirable in domestic work, and the end elevation is over-windowed. The plan, as a house, has good parts, but the business-room is forgotten by placing it on the far side of the hall from the main entry. "St. Nicholas" gives shaped gables to a closely-schemed plan, well contrived, with economy and skill in detail of arrangement. The bath-room is too much separated from the bedrooms, but the w.c. is neatly screened. The elevations are wanting in architectural idea. "Novocastria" sends a good, well-arranged sheet, including a view. The blunt apex gables are not attractive; but the plan has merit—such as the screening of the hall from the porch, and the library is handy, though its door is in the wrong corner. The first floor is a practical arrangement, rather devoid of charm which only comes of architectural planning. "Loides" deserves about the same degree of approval; and what is more, he draws carefully, though with absence of personality of touch. His mean-looking chimney-stacks are poor things. "Jingo" is exceedingly neat, and his elevations, particularly that towards the south, rank as rather good and well composed; indeed, the house would look suitable and good. The garden door is neatly managed 'twixt the two parlour bays. We would advise "Jingo" to draw with a bolder line, and to continue taking pains. The mullions of windows should be blacked-in on the plans. "Puck" has a poor plan, and we cannot find room to point out its defects in detail; but if he were not as good as he is, his name would be only mentioned. The arched opening to drawing-room from the terrace looks like a stable archway on the south front. "Adze" has a well-balanced scheme, with a fair degree of thought expended, which always repays the worker. Let him read what is said about others, and take the hints to himself. He is workmanlike, and if willing to learn will improve. "Marcus" is unequal, and should study some good men's work, architecturally considered. The curved porch is too clever to be convenient. "Kangaroo" is rather odd, but has seized the general idea of Georgian simplicity in a way which could be developed skillfully;—only let him, pray, omit battered chimney-shafts from the ground upwards. The entry to the drawing-room is more suited to the front door, and in itself would be pretty if well detailed. The staircase hall is ugly and rise to stairs awkward, impinging upon the passageway. "Pan" has a circular turret with stairs out of servants' hall, as if that room served as an entrance hall. The plans are compact. "Digniori" draws in outline and gives patterned gables, which are open to improvement in shape. "Tryfan" does not show the entrance front. The others are ordinary, but inoffensive. "Mr. Deoley" has a fancy for fun, and in the drawing-room is a niche for his bust to balance the importance of the angle-set fireplace opposite. The plan is not half a bad one, though we think there is too much fancy outside. The saddle-backed belvedere between the chimneys has two balconies—one to the N.E. and one to the S.W. "Knight" is commonplace, and his entrance portal seems a variation of something which we have seen before. "Sam" slopes with a battering wall the ends of his house, and draws as if he wanted to erect a ruin. The

whole thing seems disjointed. The kitchen looks like a passage: it is so long as compared with its width, and the pantry is bigger than the "kitchen." The entrance hall is said to be for dancing. "Sau" ought to do something better than this another time. "Plumb-bob" has a fairly good plan, but the stairway is too much in evidence from the porch. The long slope over the hall is out of keeping with the style of house. The loggia of "Leo's" house is the best part about it, but he does take trouble, but he wastes room in his passages shockingly, and they are very dark, too. "Six and Eightpence" is a capital draughtsman, and his N. elevation approaches a success; but we do not like the octagonal tower to drawing-room angle of the house. The separate entry to the office is ingenious, but not so good as the first plans.

"D'Artagnan" plods on and seems improving. We wish he would throw a little "go" into his patient work. "A Scot" gives us a clients' door, but we do not want our clients knocking at our study door, or Christmas carol singers shouting, "All seated on the ground" under our very noses as they could here. The entrance has a very pointed Gothic lancet arch. "Friar Tuck" is not domestic looking enough, and his central corridor rambles about all over the building. The kitchen has two canted corners with a door in each.

"Imprimatur" has a plain sort of house which we should not object to if he would only invest it with a little grace. It has a scattered plan. "Zig Zag" is old-fashioned, and clutters up his building without any idea of the value of wall space, and the plan is spoiled by the incongruous shape of the hall. "Frena" provides a big tower to supply a belvedere, and the effect is broad and old-world-like, as shown by the sketch. The plans are neat; but the first floor landing, 20ft. by 10ft. 6in., is very wasteful. The parlours are spacious, the library being in the wrong place. "Consul" adopts the silly trick of blacking in solid every other tile of the paving. "Vulcan" ought to go up higher. He gives an extra door to the business-room; but that makes it too much a convenience for any beggar-man to call at all hours. The loggia is costly and pretentious. "Criss Cross" has a bad sprawling plan and ugly elevation; but he shows individuality, and hope something more worthy of the effort may come of it another time. "Frouge" does not excite our interest; but we think he might do better. "Val" is in the same unsatisfactory stage. We want to encourage him, for he is certainly industrious, though he draws on the wrong-sized paper—see new rules. "Bucolic" ends the second class of designs with very careful work, and a well-balanced façade.

The remainder of the plans come in the following order:—"Marquis," "Norseman," "Seasider," "Bill," "Cleddadyn," "Arabintang," "Kingston," "Jap," "Lavernock," "Dingle," "Wee Mac Greggor," "Obelisk," "Shine," "Primus," "Leofric," "Cast," "Pen," "Try," "Tenderfoot," "Vale O'Lune" (pay your postage another time, threepence excess paid), "Regent," "Nick," "Jacobean" (Hanley), "Legal" (it is contrary to rules to shade in colour), "Autocar," "Spero," "Architect," "Wee MacGreggor," (*sic*) Galashiels, "Sauvey," "Opportunities," "Quatre Vois," "Inside Right," "Croesus," "Tee Square," "Jacobean" (Halifax), and "Omega," also "Jenny Wren," in pencil, and a week late, otherwise this last proposal would have stood much higher.

The following were the conditions:—B.—A Solicitor's Country House in stone, with stone slab slated roof, on a level site, surrounded by trees. The reception-rooms should face the south and south-east, with the principal entrance on the N.W. side of the house. The gardens are on the south side, below a terraced lawn. The accommodation is to be mainly on the ground and first floors, two servants' bedrooms and a boxroom on the second floor. No objection would be taken to a belvedere, lead-covered turret and flat; but this feature is optional. The dining-room is to be 25ft. by 15ft., exclusive of a bay, if any is provided; drawing-room is to be 18ft. by 15ft., and the library 15ft. by 12ft., located conveniently for use as a business-room. There must be a good roomy panelled entrance hall, say 10ft. square, with a 4ft.-wide oak staircase beyond the hall and out of sight of the entrance to the house. The kitchen offices to be of a suitable kind, including a butler's pantry and housekeeper's

little room fitted with store cupboards so placed as to be available for the use of the mistress also. A cloakroom and w.c. are required on the ground floor for gentlemen. Five bedrooms on the first floor, a w.c., h.m.c., and a bathroom. The cost of the house to be reckoned at 9d. per foot cube to limit of £2,200. A cycle-house is not wanted, as a motor-house and stable will be built detached from the house, and need not be shown. Windows to be mullioned and lead glazed. The style based upon Tudor or Jacobean work is to be adapted to modern requirements in a simple and broad way with gables. The ground-floor rooms to be 9ft. 10in. high, and the first-floor rooms 9ft. high. Scale to be 5ft. to the inch; two elevations, one section, and three plans. Drawings to reach the BUILDING NEWS Office not later than Nov. 30.

CHIPS.

The Board of Trade inspection of the new Tanat Valley light railway will take place to-day (Friday).

The members of Hull City Council have decided to proceed with a portion of the town-hall extension scheme at a cost of £53,000.

The Bristol Libraries Committee are about to commence operations with the new central and reference library in Deanery-road. The building will be erected in accordance with plans prepared by Mr. H. Percy Adams, F.R.I.B.A., Woburn-place, W. Messrs. Willcock and Co., of Wolverhampton, are the contractors, and the cost will be about £30,000.

In the centre of the village of Bitterley, Salop, a drinking fountain of Gunhill stone has been erected as a Coronation memorial. Mr. Charles J. Watkins, of Corve-street, Ludlow, carried out the work.

An adjourned meeting of the heritors of New Monkland N.B., has been held at Airdrie to consider the report of a committee on the repair of the church. The committee had got an estimate for the work as shown in the plan by the architect, and the lowest offers amounted in all to £1,981. This was for reseating the church, making structural alterations in the east gable, heating the church, and re-erecting the gallery. The meeting decided by a majority to contribute £1,500 of the cost, on condition that the seatholders and congregation raise the balance.

An anonymous donor has placed the sum of £2,000 at the disposal of the curate of Claygate, Surrey, for the renovation and decoration of Holy Trinity Church, Claygate.

The parishioners of Holy Trinity, Ripon, have sanctioned the seeking of a faculty to remove the south transept gallery, and to make certain additions to the seating of the floor. The north transept gallery was removed in 1899.

The building committee of the Llandaff Town Council have resolved upon spending £2,000 in widening roads and building new bridges in the parishes of Peterston, Pendoylan, Caerau, Lavernock, and Dinns Pows.

Mr. W. A. Ducat, an inspector of the Local Government Board, held an inquiry at Meole, Shrewsbury, recently, in respect of an application of the Atcham Rural District Council for sanction to borrow £3,500 to carry out a water scheme for the parish of Meole and a portion of the parish of Condover. The scheme provided for the building of a reservoir at Lythwood for the storing of water from the Wellbach and Whitty springs, and will remove the present necessity on supplying Meole from a colliery.

Four acres have been added to the new cemetery at Jesmond, by the All Saints Burial Board, two-thirds of which were consecrated by the Bishop of Newcastle last week. The ground has been laid out and inclosed from plans by Mr. Parker Brewis, architect.

Apart from one or two suburban estates, there was a general diminution in the volume and activity of business at the Tokenhouse-yard Mart last week. The principal item was the sale of freehold ground-rents of £519 per annum, secured upon 117 houses and shops in Wandsworth and Holloway, with reversions in 63 to 82 years, which realised £20,718. Another estate of 37 houses and shops in Putney, Pimlico, &c., brought in a total of £11,170. The total for the week was £72,105.

At the Westminster Roman Catholic Cathedral, on Wednesday, the great cross which will hang over the chancel was placed in position. The cross, which was blessed by Provost Johnson on Sunday morning, measures 30ft. by 22ft. It is gilded and has been built abroad of teak and mahogany. The figure of Christ, painted on canvas by Mr. C. Symons, is stretched on the front of the cross, while the figures of the Four Evangelists are placed at the angles. On the back is a representation of the Virgin Mary.

OBITUARY.

MR. WILLIAM WARLOW GWYTHYR, F.R.I.B.A., died on Thursday in last week at 9, Clifton-hill, N.W., aged 73. Mr. Gwyther, who had been a Fellow of the Institute since 1880, had practised for many years at 26, Bedford-row, W.C. The funeral service was held at All Saints' Church, Finchley-road, on Tuesday, at noon.

CHIPS.

At St. Paul's Cathedral on Wednesday the unveiling and dedication took place of a marble panel to the memory of Sir John Stainer. The memorial, which is the work of Mr. H. Pegram, has been set in the wall of the north transept. On the upper portion of the panel is a carved representation of a vision of Christ. A worshipper kneels with outstretched arms before an altar, and, in the midst of the smoke arising from the offering, Christ sits enthroned, surrounded by cherubs. In front of the altar are the words, "I saw the Lord." On the lower portion of the panel is a sculptured portrait of Sir John Stainer, set in a wreath of laurels, and beneath it is the following inscription:—"In memory of Sir John Stainer, Art.Mag., Mus.Doc., Organist of this Cathedral, 1872-1888."

The donor of the site on Denmark Hill for the new buildings of King's College Hospital is the Hon. W. F. D. Smith, who is the Chairman of the Removal Committee and Treasurer of King's College.

A scaffolding accident occurred at the Central Railway Station, Glasgow, on Wednesday, resulting in the death of one and the serious injury of three men. The accident took place at the extensions at present under construction on the south side of Argyll-street, and immediately over Ann-street. Much of the girder work of the new station has already been put into position, and a large number of riveters are employed in carrying through the operations. A platform erected at a height of 50ft. on the girder work collapsed, and four persons employed on it were thrown to the platform level.

The roof of the Roman Catholic chapel at Wellington (Salop) suddenly collapsed on Wednesday morning. A stained-glass window, several oil paintings, and the mission cross were destroyed. The damage is estimated at £3,000.

At St. Michael's Church, Minehead, Somerset, a stained-glass east window and a Bible desk were dedicated as memorials last week. The window is the work of Mr. Henry Holiday. The four principal lights relate events in the life of our Lord before and after the Crucifixion. The three upper divisions of the window exhibit the nine orders of angels. The Bible desk is the work of Mr. Nelson Dawson, and is of wrought iron, brass, and oak. The centre figure is of St. John the Baptist showing the label "Ecce Agnus Dei." Figures of angels at the sides, each under a small crocketed canopy, complete the design.

St. Paul's Church, Dorking, which has just been restored and renovated at a cost of £1,600, was reopened on Tuesday in the presence of the Bishop of Winchester.

The House Committee and Committee of Treasurer and Almoners have unanimously recommended the Governors of St. Bartholomew's Hospital to take steps to ascertain the possibility of acquiring further additions to the site. This course is approved by the medical and surgical staff. The acquisition of more land will necessitate the reconsideration of all previous plans for wards and other new buildings. With reference to this scheme for reconstruction, the *City Press* states that the possible competition of the Post Office for the additional land required has been disposed of by the decision of the Corporation to persevere with the construction of a proposed thoroughfare through the estate. The buildings to be erected on the north side of the new street will not interfere with the land needed for the hospital.

The City Court of Common Council have received a report from their museum committee announcing that, under the bequest of the late Mr. George Gilbert, the brother of the late Sir John Gilbert, R.A., twelve oil paintings and 81 water-colour drawings by the latter distinguished artist will be added to the collection of his works in the Guildhall Art Gallery. The new pictures, which include several landscapes and some historical scenes, have been hung this week.

Mr. E. A. Sandford Fawcett, M.I.C.E., L.G.B. inspector, conducted an inquiry at the Clubroom, Chudleigh Knighton, on Friday, into the application of the Newton Rural Council for sanction to borrow £330 for the execution of works for supplying Chudleigh Knighton with water.

At the meeting of the managers of the Metropolitan Asylum District held on Saturday, a letter was read from the Local Government Board authorising the execution of alterations and additions to the Fountain Hospital, at a cost of £15,000.

Building Intelligence.

BIRMINGHAM.—The church of St. Luke the Evangelist, Bristol-street, Birmingham, has been reopened for public worship after rebuilding. More than four years ago the church that had stood on the site since 1841 was found to be in a dangerous condition, it having been built of soft local sandstone, and on an insecure foundation. The city surveyor ordered the demolition of the building, and from that day the services were held in a neighbouring building that had been built for a mews, and had been used as a music-hall. As far as funds have permitted, the designs of Messrs. Mansell and Mansell have been carried out by Messrs. John Barnsley and Sons. The new church is larger than the old one, and has seating accommodation for about 800 worshippers. It is 135ft. long and 80ft. wide, consisting of chancel, nave, and transepts. The Perpendicular style has been adopted, and to increase the apparent length of the edifice the usual chancel arch has been dispensed with. The roof of the nave is supported on slender arches. Beneath the organ loft are three vestries, and a room for parochial meetings is provided under the chancel. The schools are also connected with the church. Hollington stone has been used for the building, and the woodwork is of oak. A lofty square tower, with pinnacles, is to be added, with a clock and eight bells. The brass of the old foundation-stone, laid by Bishop Pepys, has been affixed to the wall of the south-west porch. It records the names of the architect, Mr. Harvey Edgington, and the builder, Mr. George Horten, of the former church.

BRISTOL.—The new pulpit in course of erection in the nave of Bristol Cathedral will be inaugurated on Christmas Day by a sermon to be preached from it by the Dean. The pulpit has a body octagonal in plan, with carved scenes in Christ's life occupying five of the panels. It is supported on a centre column surrounded by smaller shafts, and access to it is by a carved stone staircase. In style it is of English Gothic of the end of the 14th century, though original in its design. The materials are white Beere stone, and Rosso marble for the detached columns and plinth. The scenes represented in the five sculptured panels referred to are the Nativity, the Baptism, the Crucifixion, the Resurrection, and the Ascension. The pulpit stands backed by one of the large piers, and commands the cathedral well. It is moulded, and has carved ornamentation and details. It is the gift of Mrs. Colman, of Bristol, and is in memory of her late husband. It was designed by Mr. G. F. Bodley, R.A., of Gray's Inn, and its execution was intrusted to Mr. Turner, of London.

BURY, LANC.—The new buildings of Bury Grammar School, which were opened yesterday (Thursday) by the Earl of Derby, form a valuable addition to the places of secondary education in the county, and supply, by their equipment, the needs of the populous area which has its centre in Bury. The architect is Mr. W. Venn Gough, of Bristol. The buildings comprise only part of the whole design which the Governors of the school hope in due course to carry out. This shows a complete quadrangle, embracing separate schools for the respective accommodation of 350 boys and 200 girls; but at present only two sides and a half of the quadrangle have been erected. The cubic contents of the contemplated schools were stated at 877,456ft., and the estimated cost was put at £19,280. In the centre of the quadrangle there is ultimately to be a large assembly-hall, capable of seating about 600 persons.

CROPTHORNE.—Mr. Drinkwater Butt, F.R.P.S., of Gower-street and Kensington, has just completed designs and accepted the tender of Mr. A. Cliff, of Eveham, for additions and alterations at The Den, Crowthorne, Wiltshire, the residence of Mr. A. H. Avery, a partner in the well-known firm of scale-makers of Birmingham. This picturesque country house, overlooking the valley of the Avon, was originally a group of cottages of the half-timber period characteristic of the neighbourhood, and was converted into a single house by the late Sir Lawson Tait, the eminent surgeon. Since the property came into the hands of Mr. Avery it has been further improved under the direction of Mr. Edwin Lutyna and Mr. Drinkwater Butt, the former designing the quaint-sunk garden, and the latter restoring the old-style leading of the windows, and being now responsible for the additions, new gables,

&c. Great care has been taken in the preservation of the old work, and in making the new to thoroughly harmonise with it.

ILFRACOMBE.—The new church of St. Peter, in Highfield-road, which has been built from the designs of Mr. G. H. Fellowes Prynne, was consecrated on Thursday in last week by Dr. Robertson, Lord Bishop of the Diocese. The church is not by any means completed, the chapel, clergy vestry, west port entrance, and tower having at present been delayed owing to the want of funds. The portion completed consists of the sanctuary, chancel, choir vestry, organ-chamber, nave, north and south aisle, north and south transepts, base of the tower, and the heating-chamber, which have occupied seventy weeks to complete. The late Mr. F. W. J. Rees, of Chelmsford, Essex, presented the church with an organ, valued at £1,200. The church is in the style of the Late Decorated. When completed it is intended to accommodate 610 persons, besides 40 for the choir. So far about £6,500 has been spent. To complete the church another £1,500 will be required.

LEEDS.—The new branch library at Holbeck was recently opened. The building has been erected under the superintendence of the architect, Mr. William Bakewell, F.R.I.B.A., of Leeds, whose design was selected by the assessor, Mr. Leonard Stokes, F.R.I.B.A., from those submitted in competition. The exterior is faced with Accrington bricks and dressings of terracotta, the roofs are slated with green Westmoreland slates, and the building generally is of fireproof construction. The whole of the floors are laid in wood blocks and marble mosaic, and the walls of the public rooms are lined with a dado of glazed tiles. The accommodation provided consists, on the ground floor, of large reading-room, lending library, ladies' room, and librarian's room. The juveniles' room is situated on the lower ground floor, together with the usual offices, &c. The fittings generally have been arranged on lines laid down by the chief librarian, and are executed in teak and oak. The building has been erected by Messrs. Armitage and Hodgson, contractors, Leeds. The fittings and cabinet work have been carried out by Messrs. Goodall, Lamb, and Heighway, Ltd., of Manchester. Mr. H. Jones acted as clerk of the works.

SCHIVAS HOUSE, TARVES, N.B.—The Earl of Aberdeen has had restored, as a residence for his eldest son, Lord Haddo, the old House of Schivas, in the parish of Tarves. It was built about 1640 by a descendant from a younger branch of the noble family of Kinfauns. Some considerable time after the lands of Schivas became the property of a scion of the Forbeses of Craigievar, and at the beginning of last century they were bought by Mr. Forbes Irvine of Drum, who sold them to the then Earl of Aberdeen in 1845. A few years ago the mansion house, then in a state of comparative ruin, was destroyed by fire, leaving nothing but the stone walls, which are of great thickness and strength. In the restoration, which has been carried out by Mr. Cobban, architect, Haddo House, all the old features of the original building have been retained, and the house is now restored as it was nearly three hundred years ago.

The town council of Cupar-Fife have under consideration the question of draining the Burgh, and treating the sewage by means of the septic tank system, Mr. Henry Bruce, C.E., of Cupar, is preparing the scheme, for which Messrs. Cameron, Commin, and Martin, of 1, Victoria-street, Westminster, S.W., are acting as consulting engineers.

Harry Sleeman, a clerk of works, employed by Messrs. Jay's, Regent-street, and living in Flanders-road, Bedford Park, was on Saturday, at Marlborough-street Police-court, remanded, charged with defrauding his employers of £148, by means of falsifying accounts under his care between Dec. 24, 1902, and Dec. 10, 1903. The alleged fraud was discovered when the books were investigated while the accused was temporarily absent through illness.

As a result of the removal of the Brett Memorial in Malling Church, a 13th-century window hitherto concealed by brickwork was opened out. The Brett memorial was erected in 1620 in the south wall of the chancel. In 1870 the whole church, with the exception of the chancel, was pulled down, being considered unsafe, and rebuilt. It was evidently intended originally to include the chancel in the scheme of demolition, but this was happily averted by a special resolution. In 1901 the whole nave was rebuilt. The window has remained open during this week, but very shortly the replacing of the memorial must cover it again.

INDEMNITY MUTUAL MARINE INSURANCE OFFICES, OLD BROAD STREET, E.C.—WATERLOO HOTEL, JERMYN STREET, W.—NATIONAL SILVER MEDAL DESIGNS FOR POTTERY PANELS.—"AVOCA," PRENTON.—DESIGNS FOR A SOLICITOR'S COUNTRY HOUSE.—THE BELL INN, MARTLESHAM.

Our Illustrations.

INDEMNITY MUTUAL MARINE INSURANCE CO.'S OFFICES, 1, OLD BROAD STREET.

THIS new building, which is being erected at the junction of Old Broad-street and Threadneedle-street, occupies the site of a building formerly the property of the Imperial Fire and Life Insurance Company. Upon the amalgamation of this company with the Allied Assurance Company, Limited, the Imperial Office was removed to Bartholomew-lane, and the site of the old office sold to the Indemnity Mutual Marine Insurance Company, Limited, who are erecting the new building. The former building was of good classic proportions, and was designed by Mr. Thomas Gibson, who also designed the National Provincial Bank of England, close by. The building, however, was unsuited for modern requirements, both as regards height and lighting area, and had to be removed. The new building, the design of which is published to-day, contains six floors of offices, with an additional basement over part of the site, containing strong-rooms and heating-chambers, &c. The principal entrance is from Old Broad-street, but a subsidiary entrance leads into Threadneedle-street. The main entrance leads directly to a lift, which serves the whole premises. The various floors are designed without columns or obstructions of any kind, so as to be easily divisible into suites of offices. On the lower ground floor suites of lavatories are arranged, special provision being made for principals and managers while in the building. The façades are being erected in Portland stone throughout, all interior areas being lined with white glazed bricks, and the entrance and staircase are to be lined with marble and faience linings throughout. The whole of the floors are of fireproof construction, and the floors of the corridors are to be laid with mosaic paving. The works are being carried out by Messrs. Colls and Sons, of Coleman-street, from designs and under the personal superintendence of Mr. H. Chatfield Clarke, of Bishopsgate-street Within. Mr. W. Crossley is acting as clerk of works.

WATERLOO HOTEL, JERMYN STREET.

(For description, and plans of ground and first floors, see page 823.)

NATIONAL SILVER MEDAL DESIGNS FOR POTTERY PANELS TO A FIREPLACE.

THESE panels illustrate "Recreation" in the form of "Literature or Reading and Music." In the centre panel a group of maidens are listening to some passages of a romance read by the fair authoress herself. The folio from which she is reading is held by a little slave boy, whose pre-occupation contrasts with the eager enthusiasm of the other bearers. The figures emblematic of Music in the two side panels have ceased play-

ing, and are also listening to the story. The colour scheme is carried out in rich greens, blues, purples, and creamy whites, lighted with splashes of orange amongst the trees. A somewhat complicated, though very interesting, process is employed. The body of the panels is a rich terracotta clay, upon which, whilst wet, or, to use a technical term, whilst in the "green" state, the whole of the design is painted in coloured clay washes called "slips." This slip is then removed on the outlines until the terracotta body shows through. The panels are then placed in the oven and fired, coming out in what is known as the "Biscuit" state. Details, such as the patterns on draperies, &c., are then added in underglaze colour, and the whole is dipped in a toned transparent glaze. They now go through the gloat-oven fire, and are ready for use. This method, which is really a combination of several processes used in a distinctly individual way, results in peculiarly fine colour effects, and is especially adapted to interior decoration. In this case the panels form the centre of a scheme for the decoration of a fireplace of walnut wood, the luscious glaze effect being echoed by the glass in the doors of a little cupboard above. We propose to illustrate a view of the fireplace shortly from the author's sketch. A silver medal was this year awarded for the design to Mr. Herbert Ashwin Budd, of Fulham.

"AVOCA," PRENTON.

THIS country house was designed by the late Mr. J. J. Talbot, of Liverpool, who lent us the drawings shortly before his recent decease. The plans show the arrangement of the building, which has three reception rooms and six bedrooms, a feature, for the sake of the view, being made of a canted alcove in the drawing-room, rather well managed. The main walls are rough-cast.

"BUILDING NEWS" DESIGNING CLUB: A SOLICITOR'S COUNTRY HOUSE.

(For description and awards see page 823.)

THE BELL INN, MARTLESHAM.

THIS sketch shows an old Suffolk example of domestic work known as the Bell Inn at Martlesham. It is chiefly remarkable by reason of the ancient framing of the hoist projecting over the street and attached to the inn. This gangway originally communicated with a malting or store to the rear of the premises. There is not much to be said about the building, though its upper stage is in half-timber. Without any pretensions, and having seen its best days, the old house is well in keeping with its surroundings, helping to add to the quaintness of a rural street in a picturesque village.

Mr. Silvanus Trevail, of 80, Lemou-street, Truro, and of 13, Sherborne-lane, E.C., ex-president of the Society of Architects, F.R.I.B.A., who died at Bodmin on Nov. 7 last, has left estate which has been valued at £6,908 15s. 10 1/2d. gross, and at £4,401 5s. 1d. net, by his sister, Mrs. Laura Rundle, of Trevollard, Lanreath, wife of Mr. Richard Rundle, the sole executrix of his will.

The construction of a new Congregational church has been begun at Lynton, North Devon, the whole cost of which is to be defrayed by Sir George Newnes, M.P. The new church is to take the place of a building which was erected in 1850, and which had accommodation for only 250 persons.

Mr. A. D. Price, M.Inst.C.E., engineering inspector of the Local Government Board for Ireland, has held an inquiry in the town-hall, Dundalk, into the application made by the Dundalk Urban District Council to the Local Government Board for their sanction to loans of £5,000 and £500, for the purpose of erecting working-class lodging-houses under the Housing of the Working Classes Act, and defraying the extra expenditure incurred in the carrying out of alterations at the town-hall respectively.

At the last meeting of the Folkestone Chamber of Commerce Mr. W. White presented elaborate plans for the proposed winter gardens on the sea-front, at an estimated cost of £30,000. The whole scheme is to be brought before the town council at an early date.

The city council of Bristol authorised their sanitary and improvement committee to obtain sanction for a loan of £11,500 to cover the expenses incurred in compensating owners of land acquired for the purpose of widening some 40 thoroughfares in the city.

The town council of Warrington have been authorised to borrow £21,396 for street improvements, and £12,296 for the purposes of private street works.

COMPETITIONS.

OLDHAM.—The new Board schools competition at Oldham has been settled. The assessor (whose name is not stated) awarded the first place to Messrs. Henry Cheers, of Twickenham, London, and Smith, of Blackburn, joint architects, and second place to those sent in by Messrs. Woodhouse and Willoughby, of Manchester. The drawings have been on view this week. The arrangement was for 1,200 on the ground floor, 400 senior and 400 junior in one mixed school, and 400 infants. The site is almost square, but falls about 25ft., and one corner of the land is almost 3ft. above the level of the other, while diagonally the levels vary even more, about 14ft. one way and 11ft. the other. The successful plan doubtless has hit on a scheme to meet the difficult question of the levels, as the mixed school for 800 with a central hall would be over 200ft. long. We hope soon to illustrate the accepted design, which has been promised us by the architect's.

ROCHDALE.—Competitive plans for the erection of the new elementary school at Greenbank were recently sent in to the Education Committee of the Rochdale Corporation. The plans of Messrs. Butterworth and Duncan, architects, of Rochdale, have been recommended for adoption.

TAMWORTH.—There were 163 designs submitted in the competition for a new free library, Tamworth. The design placed first is by Mr. E. R. Danford, A.R.I.B.A., architect, Temperance Hall, Northampton; the second design is by Messrs. Herbert T. Buckland and E. Haywood Farmer, architects, Birmingham; and the third design is by Messrs. Hodge and Haswell, architects, Teddington. The assessor was Mr. Jethro A. Cossins, architect, of Birmingham.

CHIPS.

A proposal has been made to place a window in Strathfieldsaye Church to the memory of the late Duke of Wellington.

Mr. H. C. Richards, K.C., M.P., has intimated his intention to give to the parish church of St. Peter, Newlyn, a stained-glass window in memory of the late Lord Salisbury. The window, which is designed as a companion to that in memory of the late Lord Idlesleigh, will illustrate the parable of the Good Shepherd.

Plans have been prepared for the construction of a new dock in Trafford Park, Manchester, on the north-easterly side of Trafford Hall.

It is proposed to provide a bridge for vehicular traffic across the Wye, near Tintern Abbey. At present persons proceeding between Tintern and the Forest of Dean have to go round either by Chepstow or over Bigsweir Bridge, either being several miles out of their way. Towards the estimated cost, the Lydney District Council have voted £1,200, and the Gloucester County Council, £1,000.

The King's Norton Urban District Council have accepted an offer from Messrs. Cadbury Brothers of a piece of land at the corner of Bournville-lane, Stirchley, containing 1,240 square yards, for public baths and washhouses, conditional upon the necessary buildings being erected, at a cost of not less than £5,000.

Messrs. Wailes and Strang, artists in stained glass, Newcastle-on-Tyne, have despatched, per ss. *Manitoba*, a large window of three lights, and also lancet window for St. Luke's Church, Woodstock, New Brunswick, Canada. The windows will be unveiled on Christmas Day.

A new aisle was opened on Tuesday in the Church of the Immaculate Conception, better known as the Jesuit Church, Farm-street, Berkeley-square. The aisle, which is in the Flamboyant Gothic style, has five chapels—one, near the main entrance in Farm-street, being a Calvary chapel in memory of Mr. Bertam Currie, and another, to the left of the high altar, is dedicated to St. Ignatius Loyola.

Very good progress is being made with the laying of the second pipe of the Thirlmere line of aqueduct to Manchester. Over a thousand men are engaged on the work, and during the last fortnight about a mile of pipe has been laid. Only eight and a half miles now remain to be laid, and it is expected that the work may be completed by next midsummer.

Mr. W. D. Barrow, executive engineer, on return from leave, has been appointed deputy consulting engineer to the Government of India for railways, Calcutta.

The Bishop of Colchester will unveil a memorial window and tablet to the memory of the late Bishop of St. Alban's (Dr. W. Festing) on Sunday next at Christ Church, Regent's Park, London, where the late Bishop was for many years vicar.

PROFESSIONAL AND TRADE SOCIETIES.

GLASGOW ARCHITECTURAL ASSOCIATION.—The fourth ordinary meeting of this association was held in the hall of the Philosophical Society, 207, Bath-street, on Wednesday, the 9th inst., when a very interesting paper was read by Mr. Theodore Fyfe, architect to Dr. Evans's Excavations at Knossos. Excavations have been carried on at Knossos for four seasons since 1900 by Dr. Arthur Evans, and there is every probability of a fifth. Knossos is perhaps the most important of a series of palaces in the island of Crete of the Minoan period, a period anterior to that which produced the Mycenaean palaces on the mainland of Greece. Probably no other site, either in Greece or Egypt, has yielded such a variety of small finds, many of which, as well as the architectural features of the palace, are new, and of the first interest. It is evident that at Knossos also we find the true solution of all legends about the Minotaur and the Labyrinth of Crete. The date of the existing palace stretches from about 2000 to 1500 B.C., as important evidence of Egyptian influence has corroborated. An earlier and a later palace can be traced, the first having connections with the Egyptian Hyksos, or Shepherd Dynasties; the latter broadly contemporary with the Egypt of Thothmes III. It is highly probable that the Minoan races were the Kefim, or "people of the isles of the sea," represented as bringing tribute on an XVIII. Dynasty wall painting in a tomb at Thebes. The palace is, roughly speaking, four-square, with a great central court, which, being longer than it is wide, divides the plan into two portions—a western and an eastern—with connecting wings north and south. Standing on a slight eminence which has two steeply sloping sides, an opportunity is gained for a series of deep rooms on the east side, which consist of two and even three stories. These rooms constitute the most remarkable architectural developments of the site, but special mention should also be made of the throne room, on the western side, which has stone benches round the walls, and a curiously carved stone throne. The palace was originally decorated with splendid frescoes, in relief and in the flat. Among the interesting remains of these that have been found may be mentioned the upper part of a youth, very elegantly drawn, who is apparently carrying a vase of gold and silver. Many of the other finds are of extraordinary interest. Some 1,600 clay tablets show a highly-developed system of writing in a hitherto unknown style. Vases and other utensils have been found in pottery and fine stone, exhibiting the most beautiful workmanship and design. An almost complete ivory statuette of a leaping youth, a lioness's head in alabaster, and a life-size bull's head and foot in painted "gesso-duro" relief, are among the most perfect specimens of ancient art, and can hold their own with Greek work. A capability of working to great perfection in almost any material is evident—such materials as ivory, crystal, gold, enamelled porcelain, pottery, and fine stone—and the sum total of the discoveries enables us to know much that is interesting about life in a Minoan palace. The lecture was illustrated by a number of highly interesting slides. A discussion followed the reading of the paper, in which Mr. Newberry, Mr. Bromhead, and others took part.

INSTITUTE OF SANITARY ENGINEERS.—The annual dinner of the institute was held on Wednesday night at the Holborn Restaurant. Mr. W. J. Dibdin, president, occupied the chair, and the company numbered upwards of seventy gentlemen. The chairman, in responding to the toast of "The Institute," said it was formed in 1895, with a commencing number of about 100 members. This number had steadily increased, until at the present time the membership stood at 504, consisting of 266 Fellows, 19 members, 216 Associates, and three student members. During the present year seven Fellows, 36 Associates, and two student members had been elected. The objects of the institute were to provide an organisation for sanitary engineers, with the view of promoting the interests of the profession and of elevating its status. With this view examinations were held and certificates issued on their results. During the past year two examinations had been held in London and one in Manchester. At the London examination 21 candidates had presented themselves, and five at Manchester, 14 complying satisfactorily with the requirements of the examiner. Next year it was proposed to hold an examination in Liverpool. During the past year 20 lectures had been

given to students by men eminent in their respective professions, and one of the most useful features of the work of the institute was the arranging for Saturday afternoon visits of members and students to various places of interest where sanitation could be studied under practical conditions.

LEGAL INTELLIGENCE.

ACCIDENTS DURING MEAL-TIMES.—*BLOVELT v. SAWYER*.—In the Court of Appeal, on Friday, judgment was delivered by the Master of the Rolls and Lords Justices Mathew and Cozens-Hardy in this action, which was an appeal from the decision of the Judge of the North Shields County-court in an arbitration under the Workmen's Compensation Act, 1897. On October 15, 1902, the appellant, a bricklayer in the employment of the respondent, was engaged on the building of a house more than 30ft. in height. During the morning he was working at building a wall. On the arrival of the dinner-hour, which was from 12 to 1, he sat down under the wall to eat his dinner. He had only just done so when the wall came down, and he was seriously injured. The evidence showed that the applicant might have gone away to have his dinner if he had liked, but that those men who brought their dinners generally stayed. On the occasion in question one bricklayer and one labourer went away for the dinner-hour; the rest remained. There were three bricklayers employed. The applicant received a little more than £2 a week, and it was stated that he was paid according to the number of hours he worked; but the dinner-hour was excluded in calculating the number of hours for which he received pay. The County-court Judge was of opinion that, as the applicant had sat down for the purpose of eating his dinner when the accident happened, the accident did not arise out of and in the course of his employment, and he therefore dismissed the application for compensation. The applicant appealed. The following cases were cited:—"Smith v. Lancashire and Yorkshire Railway Company" (1899); "Lowe and Pearson" (1899); "Armitage v. Lancashire and Yorkshire Railway Company" (1902). The Court allowed the appeal and remitted the case to the County-court Judge. The Master of the Rolls said that the applicant was a bricklayer who, at the time of the accident for which he claimed compensation, was engaged on building a house and was paid by the hour, though this did not appear from the judge's notes. The evidence only stated that he was receiving about £2 a week. He was at liberty either to go away during the dinner hour or to stay on the premises. He stayed, and sat down under a wall on which he had just been working for the purpose of eating his dinner, when the wall fell and he was injured. The County-court Judge had come to the conclusion that the accident did not arise out of and in the course of the applicant's employment. On the actual evidence he (the Master of the Rolls) would not have felt any difficulty in coming to a conclusion. It seemed to him that *prima facie* the applicant was in the employment of the respondent during the whole of each working day from the time when he went to his work to the time when he came away from his work, and just as much so during the dinner hour as during any other part of the day. He thought the time of employment embraced all the time occupied in coming, going, and stopping for any purpose ancillary to the applicant's work. It had, however, been stated to them that the applicant was not paid by the week or by the day, but by the hour, and that the dinner hour was excluded in the computation of the time for which he received payment, as being an hour during which he was not supposed to work. That, no doubt, created some difficulty, or at any rate afforded ground for some consideration. It seemed to him that if the dinner hour could be counted as part of the time to be used by the applicant for purposes ancillary to his work, as, for example, for eating necessary food, it would be taking a strained view to say that the pause in the work for dinner was a break in the employment. He thought that, notwithstanding the fact that the applicant was paid by the hour, and the dinner hour was excluded, the Court ought to take a broad view and treat the dinner hour as part of the time of employment. For the master to allow his workmen to have their dinner on the premises might very well be a matter of mutual convenience. He could not say as a matter of law that the applicant during the dinner hour ceased to be in the employment of the respondent. The appeal would therefore be allowed. The Lords Justices delivered judgment to the same effect.

THE LONDON WATER COMPANIES' ARBITRATION.—In the House of Lords, on Monday, before the Lord Chancellor and Lords Macnaghten, Shand, Davey, Robertson, and Lindley, an appeal was heard of the Kent Waterworks Company against decisions of Mr. Justice Joyce and the Court of Appeal (the Master of the Rolls and Lords Justices Romer and Cozens-Hardy) to the effect that the appellant company could not make up deficiencies in

back dividends earlier than the year 1864. Their Lordships unanimously dismissed the appeal. The hearing of the appeal had been accelerated for the purpose of finally deciding certain legal questions for the guidance of the London Water Companies' Arbitration, now sitting under the Act of last year.

LONDON WATER ARBITRATION BOARD.—At Tuesday's sitting of this Court the president delivered judgment on the claim of the East London Water Co. They held that the waters of the river Thames and Lea must be taken for the purposes of their award as capable of being supplied in good condition for domestic purposes, and, on the assumption that the undertaking was liable to be valued as subject to the payments to the Chamberlain's fund, awarded the company £3,900,000. If they were wrong as to that liability, the award would be £1,300,000. The company's taxed costs are to be paid by the Water Board. The company's claim was £6,583,934. After the Court had also given their decision on a point respecting the time of payment to the sinking fund for the Staines reservoir, the case of the West Middlesex Water Co. was opened.

FRONTAGE LINES.—James Rossdale, of Pembroke-villas, Bayswater, was summoned at Marylebone Police-court on Friday, at the instance of the London County Council, for erecting certain buildings at 60 and 62, Westbourne-grove, in contravention of the condition attached by the Council to their consent to the buildings being built beyond the general line of frontage. Mr. Thos. Chilvers prosecuted for the Council; Mr. Nonweiler, solicitor, defended. The district surveyor gave evidence that in November, 1902, the defendant applied for the Council's consent to the buildings being erected beyond the general line of frontage, and in March last the consent was given, subject to a condition that prior to commencing the work he should give up 6ft. of the forecourt, to be the public footway. The defendant agreed to the condition, but he had only surrendered 2ft. 6in. of the forecourt, although the buildings were well in progress, the remainder of the 6ft. being enclosed by a hoarding and a low wall. Mr. Nonweiler pointed out that the wall belonged entirely to the owner of the adjoining property, and that the hoarding had been put up to protect the public. Mr. Curtis Bennett remarked that in his opinion the defendant had committed a distinct fraud on the London County Council. He had obtained a concession subject to his first giving up a certain portion of land, and had gone on building without complying with the condition. He should make an order for the building to be pulled down at once. He also fined the defendant 40s., with two guineas cost.

CHIPS.

Mr. S. L. Pearce has been selected by the Electricity Committee of the Manchester City Council to succeed Mr. G. F. Metzger, on Feb. 1, as chief electrical engineer of that city, at a salary of £800. Mr. Pearce has been the deputy chief engineer since March, 1901.

The Duchess of Albany visited the County-hall, Kingston-on-Thames, on Friday, to unveil a statue of Queen Victoria, seated in the Coronation chair, which has been placed there as a county memorial of the reign of her late Majesty. It has been modelled by Mr. John Adams Acton, and executed in terracotta by Messrs. Doulton and Co., of Lambeth. Her Royal Highness also unveiled a South African war memorial tablet of latton, and a portrait of the present chairman of the Surrey County Council, Mr. E. J. Halsey, painted by Mr. William Carter.

Lord Monkswell, Chairman of the London County Council, unveiled, on Friday, a memorial to the late Sir Walter Besant, erected in the crypt of St. Paul's Cathedral, by the members of the Society of Authors, of which he was the founder, and other friends. The memorial takes the form of a bronze tablet with a portrait bust in the centre, surrounded by a wreath of laurel and supported by two bay trees, the work having been executed by Mr. G. Frampton, R.A. The tablet has been placed in the centre of the south wall of the crypt, between similar memorials to the late Charles Reade and George M. Smith (the originator of the "Dictionary of National Biography.")

At a special meeting, on Monday, of the Helensburgh Town Council it was unanimously resolved to make a still further extension of the works in progress for giving additional water storage. Instead of completing the supplementary reservoir for supplying Upper Helensburgh, as contracted for, the reservoir will be constructed to contain five million gallons instead of one million, the additional cost being £1,500.

The additions to the General Hospital, Rotherham, are being warmed and ventilated by means of Shorland's patent double-fronted Manchester stoves incased in richly-glazed faience, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, Clement's House, Clement's Inn Passage, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED.

Telegraphic Address:—"Timeserver, London."

Telephone No. 1633 Holborn.

CHRISTMAS WEEK.

Owing to the interruption of business caused by the Christmas Holidays, the BUILDING NEWS for Dec. 23 will have to be published on WEDNESDAY MORNING, Dec. 23.

All advertisements for that issue, therefore, must reach as before 3 p.m. on TUESDAY, Dec. 22.

Correspondents and others will oblige by sending in Lists of Tenders, &c., at latest by the first post on Tuesday morning, Dec. 22.

NOTICE.

Bound copies of Vol. LXXXIII. are now ready, and should be ordered early (price 12s. each, by post 12s. 10d.), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLVI., XLIX., L., LII., LXII., LXIV., LXV., LXVI., LXVII., LXVIII., LXIX., LXXI., LXXII., LXXIII., LXXIV., LXXV., LXVI., LXXVII., LXXIX., LXXX., LXXXI., and LXXXII. may still be obtained at the same price; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Handsome Cloth Cases for Binding the BUILDING NEWS, price 2s., post free 2s. 4d., can be obtained from any Newsagent, or from the Publisher, Clement's House, Clement's Inn Passage, Strand, London, W.C.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 6d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 6d. (or 33fr. 30c.). To India, £1 6s. 6d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 6d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Situations and Partnerships.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" and "Partnerships" is ONE SHILLING FOR TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

* Replies to advertisements can be received at the office, Clement's House, Clement's Inn Passage, Strand W.C., free of charge. If to be forwarded under cover to advertiser an extra charge of Sixpence is made. (See Notice at head of "Situations.")

Rates for Trade Advertisements on front page, and special and other positions, can be obtained on application to the Publisher.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

RECEIVED.—M. H. L.—H. R. S.—X. H. A.—W. C. T.—R. O. I.—F. E. M.—K. U. J.—B. O. B.

Correspondence.

COMPETITION FOR FREE LIBRARY, WAKEFIELD.

To the Editor of the BUILDING NEWS.

SIR,—The committee disapproves of the existing conditions of the above, but is endeavouring to obtain a revision of the same.

Reasons: "The Council will themselves decide and adjudicate upon the designs, and reserve power, if they think proper, to call in the services of an architect, not being a competitor, to assist them in deciding," &c.

Readers are requested to abstain from com-

peting unless they receive a further communication to the effect that the conditions have been satisfactorily revised.—I am, &c.,

HENRY A. SAUL, Hon. Sec.

Competition Reform Society,
10, Gray's Inn-square, W.C., Dec. 14.

BRIGHTON HOSPITAL COMPETITION.

SIR,—I am requested by my committee to ask if you will kindly request your correspondents in the current issue of your journal who have dealt with the result of above competition to communicate with Mr. Henry A. Saul, our hon. secretary, at the address below.

My committee are anxious to obtain further particulars about the matter, and would deem it a favour if you would give it such assistance.—I am, &c.,

C. E. HUTCHINSON, Assist. Hon. Sec.

Competition Reform Society,
10, Gray's Inn-square, W.C., Dec. 12.

Intercommunication.

QUESTIONS.

[12029].—Weight on Floor.—A floor is composed of joists 10 by 2, bearing 21ft. It is proposed to put a bookcase, 13ft. long, 2ft. wide, measured at base, weighing when full 3 tons, against one of the walls in which the joists bear. Without taking into consideration the weight of the bookcase, the joists are not really strong enough to take the weight usually required of an ordinary floor (viz., 1cw. per foot super.); but the floor shows an sign of deflection. According to "Hurst," p. 18 (1880 edition), a 10 by 12 joist, with 21ft. bearing, will take a safe load of some 47cw. placed at a distance of 1ft. away from the wall; so that, allowing in the present case that the bookcase will bear on twelve joists, the safe load on them, at 1ft. from wall, would be 23 tons. Am I right in considering that it will be safe to fix the bookcase as proposed, although, as pointed out, the floor itself is not strong enough to take the ordinary required distributed weight of 1cw. per foot super.? I argue as follows: The floor does its work satisfactorily at present, and as constructed it is strong enough to take a load of 23 tons distributed over a surface 13ft. in length, 1ft. away from the walls; therefore it is quite safe to load it with a bookcase weighing only 3 tons at that place, because the strain of the bookcase coming on the remainder of the floor need not really be considered. 2. Would the right way to determine the size of the joists (supposing a new floor were going to be put) be as follows? First calculate the joists to take the usual 1cw. per foot super., then calculate if they will take the desired extra weight at the desired place, deducting 1cw. for every foot super. occupied by the weight.—R.

[12030].—Footings and Easements.—In the course of a recent case in which I was interested as a witness, the learned judge's ruling was, to me, somewhat new, and I want any reader's opinion who is conversant with any settled law on the point, with references, if possible. My client (let us call him A.) bought a farm some thirteen years ago, and B. bought, at the same auction sale, an adjoining farm from the same owner. At one point the back of B.'s bare formed the boundary. On both A.'s and B.'s deeds the verge colour runs along the line of the back of the building, so that there is no dispute as to what, broadly, is the boundary. But the question is: Does B. own also the land on which his footings rest (which project 6in. beyond the face of his wall into A.), or does A. own it, subject to B.'s footings having a perpetual easement over it? If the former, then does this apply, however widely the footings or foundations spread? I have built upon railway sleepers, and upon creosoted timbers spreading sometimes 5ft. to 6ft. under the adjoining land. If the owner sells the building together with the land upon which it stands, does he sell that 5ft. or 6ft. width as well?—W. R.

An adjudication in bankruptcy has been made in the case of Clement Cooper Lloyd, of Halifax, architect and surveyor.

Mr. H. Conyers Kirby, chief assistant to the borough engineer of Polkestone, has been appointed to the post of sewerage engineer to the corporation of Blomfontein, South Africa, at a salary of £600 per annum. He sails on Jan. 11 to take up his duties.

The Swansea Corporation have decided that Mr. G. Swarbrick be promoted to the position of deputy surveyor at a salary increased to £225, that the salary of Mr. G. H. Bell be increased to £150, and that an estate agent and valuer be advertised for at a salary of £350 a year.

Mr. Batsford has for some time had in preparation an important folio volume entitled "Old Silver Work, Chiefly English, from the Fifteenth to the Eighteenth Centuries," edited by Mr. Starkie Gardner, F.S.A., with 120 colotype plates, which he was about to issue to subscribers on the 12th inst. The edition was, however, so seriously damaged in the recent fire at Messrs. Leighton's, the bookbinders, that he is obliged to defer the issue on account of the reprinting, which has become necessary. The subscription price is five guineas, but by some curious error it was mentioned in several newspapers as fifty-four guineas!

Our Office Table.

THERE was, unfortunately, practically no discussion at the Institute on Monday night, as at the finish of Mr. Henman's paper another gentleman occupied the time until ten o'clock, and then another from Birmingham got up and moved a vote of thanks in a speech which lasted a quarter of an hour, so that discussion was blocked out. Dr. Childs was afterwards asked by the President to say something, and when he commenced to condemn the "plenum" system, Mr. Henman excitedly appealed to the President to stop him. This evoked groans and other manifestations of disapproval. The President firmly, in very dignified terms, declined to allow the speaker to be interrupted. Dr. Childs was heartily cheered as he concluded his remarks. Mr. A. Saxon Snell then rose and indignantly protested against the whole time of the meeting having been taken up by Mr. Henman and his friends, discussion being thereby excluded, and asked for an adjournment of the meeting to another night to enable those present who desired to do so to express their views in respect to the "plenum" system, which he "was sure they all felt was a huge mistake." This gentleman's remarks were received with considerable applause and some cries of "No, no." The President of the Architectural Association supported the plea for an adjournment. The next meeting promises to be a lively one.

An open competitive examination for the appointment of four Assistant Civil Engineers in the Works Department of I.L.M. Naval Establishments at Home and Abroad will be held in London, commencing on Jan. 26, 1904. The limit of age for candidates is 23 to 28. The salary commences at £200 per annum, and rises by £15 a year to £300 per annum. Assistant Civil Engineers will, on first appointment, be on probation for two years, and will be eligible for promotion (by selection, without further examination), as vacancies occur, to the appointment of Civil Engineer (minimum £300, annual increment £20, maximum £350); Superintending Civil Engineer—(a) minimum £600, annual increment £25, maximum £750; (b) minimum £700, annual increment £25, maximum £850; to that of Assistant Director of Works (minimum £1,000, annual increment £50, maximum £1,200). Successful candidates will be required to satisfy the Medical Director-General of the Navy as to their physical fitness for the service. The fee for the examination will be £6. Further particulars may be obtained from the Director of Works, Admiralty, 21, Northumberland-avenue, London, W.C.

MR. HUBBARD, of the firm of Hubbard and More, architects and surveyors, 85, Greham-street, has just purchased in a London curiosity shop, for £25, a tarnished silver casket which proves to have been given, about the year 1550, to Diana of Poitiers by Henry II., King of France. The box is of wood, covered with gesso work. The casket stands on eight silver acorns, and at the corners of the lid and body are silver ornaments. A curious feature is a silver Moorish dome on the top. The South Kensington authorities look upon the find as a valuable discovery, and in a few days' time the casket will be exhibited at the museum.

The fourth annual meeting of the members of the Church Crafts League was held on Friday evening in Clifford's Inn Hall. The Dean of Westminster, who occupied the chair, explained that the object of the league was to infuse new life into the building, decoration, and furnishing of our churches, and to bring those who were responsible for these things into direct contact with artists of assured merit. It endeavoured to prevent our churches from being filled with machine-made goods, the ostensible cheapness of which was their one recommendation. The authorities of a parish church, however much they might desire to get the best workmanship, had but small opportunities for discovering the craftsman who was best qualified to give them what they wished. The result of this had generally been that they had been forced to turn to such advertisement as came in their way, and to order what they required from a shop catalogue. Artists, however, could not work as hack designers, for in so doing they would be false to their art: craftsmanship must be original and living work to have any value whatever. This league, therefore, supplied a connecting-link between the church authority and the craftsman

—a name, by the way, which included the architect and the painter, as well as the worker in stone, metal, or wood. Its endeavour was to keep on its committee men and women who were in close connection with the various kinds of arts and crafts, and through this committee to give advice to all those who might require any kind of church building or furnishing. That advice was given free, and the league was entirely devoid of commercial aims. During its four years' existence the league had received 387 applications for advice. The report of the committee was adopted, and the Bishop of Rochester was re-elected president of the league.

At the meeting on Monday night of the Scottish Society of Antiquaries, Mr. George Robertson, F.S.A.Scot., Keeper of the Abbey, Dunfermline, described two photographs of the recently discovered Norman door in the Abbey Church there, which were exhibited and presented to the society by Mr. W. Wybrow Robertson, F.S.A.Scot., H.M. Principal Architect and Surveyor of Works for Scotland. The doorway is situated at the south-east corner of the ancient Abbey Church, and had been built up for many years. It is 9ft. 7in. in height, and being of pure Norman architecture, is considered to be coeval with the original church erected about A.D. 1070. Its arch is ornamented with deeply-cut chevron mouldings, and its attached columns have finely-sculptured foliage scrolls on the capitals. A transverse slab, inserted in the columns at either end had apparently been placed there as a receptacle for the skeletons of two young persons, which were found underneath it among a mass of rubble and lime. H.M. Board of Works intends to open up and preserve this interesting doorway.

The Society of Architects' *Journal* gives a portrait and biographical sketch of the recently elected president, Mr. Walter W. Thomas. Born at Haverfordwest, Mr. Thomas received his early education at Aberystwith, with his father, who was headmaster of one of the most prominent private schools in the country, known as Pen-y-Parkau, from the small village near by. His son, Mr. Walter W. Thomas, was still young when he came to Liverpool, where for twelve years he studied architecture, finishing his architectural education at the Liverpool Institute under his old friend, Mr. John Finne, finally commencing practice in Melville Chambers. Soon after he moved to his present premises in Lord-street, where he has been established for the last 27 years. In 1886 Mr. Thomas joined the Society of Architects, and when, some three years ago, one of the vice-presidents was called abroad, the Council invited Mr. Thomas to occupy the position till the conclusion of the term of office. He has twice been re-elected, and lately was unanimously elected president. Amongst his numerous Liverpool buildings are Lewis's, the Bon Marché, the Philharmonic Hotel, Owen Owen's (in London-road), May Buildings, and Brook House. In Wales he has built a large number of board schools and workhouses. Mr. Thomas was for three years a member of the Toxteth School Board, until the district was absorbed into Greater Liverpool in 1895, in which year he was elected to the City Council without contest for the Princes Park Ward, and he is the only member of the council since that date who has been returned three times without opposition and held the seat for seven years. He was a member of the Health and Baths Committee, in the work of which he took a deep interest, especially the latter, of which he was the deputy-chairman. It will be remembered that while holding that office Mr. Thomas read an interesting paper on "People's Baths" before the Society of Architects. In a contested municipal election last year he was defeated by a strong opponent, and though asked to contest a ward last month he refused the honour in order to be able to devote more time to his duties as president of the Society.

At Colchester a Local Government Board inquiry has been held into the corporation's application for sanction to borrow £10,350 for purposes of the county lunatic asylum.

Mr. J. W. Penfold having signified his wish to retire from the office of honorary secretary, the council of the Surveyors' Institution have accepted his resignation with feelings of the greatest regret. Mr. Penfold's term of office will expire on December 31st, when Mr. Percival Currey, of 37, Norfolk Street, Strand, has consented to take up the duties of honorary secretary.

MEETINGS FOR THE ENSUING WEEK.

TO-DAY (FRIDAY).—Architectural Association. "Old Stucco and Plaster Work," by G. P. Bankart. 7.30 p.m.
Institution of Civil Engineers. "The Action of the Sea Upon the Fore-shore," by C. B. Case, Stud. Inst. C.E.; and "The Causes of the Loss of Beaches," by F. W. Cable, Stud. Inst. C.E. 8 p.m.
Glasgow Architectural Craftsmen's Society. Debate on "Should Architects be Arbitrators in Disputes on their own Work?" by R. W. Horn and Isaac Low junior. 8 p.m.

MONDAY.—Liverpool Architectural Society. Paper by E. Bertram Kirby.

TUESDAY.—Institution of Civil Engineers. "On the Resistance of Plane Surfaces in a Uniform Current of Air," by Thomas Ernest Stanton, D.Sc., Assoc. M. Inst. C.E. 8 p.m.

CHIPS.

The corporation of Preston have approved of the introduction of a water supply extension Bill next session. The estimated outlay is £200,000.

The London County Council adopted on Tuesday the recommendation of the Highways Committee that the Standing Orders be suspended to enable the Council to consider, on December 22, at the special meeting summoned for the purpose, a recommendation on the subject of the Council's exercise of its powers of purchase in respect of the London Southern Tramways Company, subject to the Lambeth Borough Council agreeing, before December 19, to contribute one-third of the net cost of the necessary street widenings. An amendment omitting the reference to the Lambeth Council was defeated.

The Lambeth Art Club had an "at home" on Saturday afternoon and evening at the rooms of the Lambeth Art Schools, St. Oswald's-place, Upper Kennington-lane, where the attractions took the form of an art exhibition, with musical and other entertainments. Mr. J. W. Godward presided, being supported by Mr. McKeggie, head master of the schools, Miss Lucy Millett (hon. secretary of the club), and other artists who have been associated with the school work. In the art exhibition were included special competition works for the occasion, which were criticised by Mr. Robert Sanber; also work for the ordinary South Kensington certificates, and for the London County Council competitions.

At the last meeting of the city council of Liverpool, a long and heated discussion arose over a recommendation by the Baths Committee "that the design for the erection of baths on the George's Dock site marked No. 6 be approved subject to the elevations and treatment of open space being amended to the satisfaction of the Baths Committee, and that the author of the design, Mr. Alfred Saxon Snell, F.R.I.B.A., 22, Southampton Buildings, Chancery-lane, London, be engaged to carry out the scheme, and that he be paid a commission of £5 per centum upon the original contract price of the building, in accordance with the terms of the conditions of the competition, and that an application be made to the Local Government Board for sanction to borrow the sum of £75,000 to carry out the work, the consideration of which was postponed by the Council on October 29, 1903." Eventually the recommendation was again referred back to the committee.

FIRE-RESISTING CONSTRUCTION

NOTICE TO ARCHITECTS, BUILDERS, & CONTRACTORS.

Completely-equipped Joinery Works, Fitted with the latest and most-improved Woodworking Machinery, have now been installed in connection with our Plant for Rendering Wood Fire-resisting, and we are prepared to contract for all the Woodwork (Carpentry and Joinery), complete and fitted-up if required, for Buildings where protection from fire is desired.

The cost for Doors, Stairs, Window Sashes, Mantels, and other Joinery made of **Fire-resisting Wood** is only about 15 per cent. more than when made of ordinary wood.

We are authorised to announce that the Fine Art and General Insurance Co., Ltd., of 90, Cannon Street, London, E.C., will allow, subject to survey, a rebate of from 10 to 30 per cent. off the current rates for risks in which our Fire-resisting Wood is used.

Fire-resisting Wood Joinery is indistinguishable in appearance from ordinary wood, and when finished by us does not differ in any respect from ordinary wood, except in the one feature that it will by itself neither sustain nor spread flames.

ESTIMATES AND SAMPLES FURNISHED FREE ON RECEIPT OF SPECIFICATIONS.

ADDRESS—

The Non-Flammable Wood and Fabrics Co.

TOWNMEAD ROAD, FULHAM, S.W. LTD.

Telegrams; "ANTIPYRINE, LONDON."

Telephone, 988 KENSINGTON.

THE BUILDING NEWS

AND ENGINEERING JOURNAL.

VOL. LXXXV.—No. 2555.

FRIDAY, DECEMBER 25, 1903.

ART AND INDUSTRY.

IF Mr William Morris had published his essays on the Arts and Crafts in dialogue form, the profession and the public would have more readily apprehended the force of the doctrines he so fervently advocated. He protested strongly against the influence of commerce upon art; he showed that tradition has transferred itself from art to commerce; that "the end proposed by commerce is the creation of a market demand, and the satisfaction of it when created for the sake of the production of individual profits." He convinced all thinking men that to the commercial producer the actual wares are nothing;—their adventures on the market everything. To the artist the wares are everything; his market he does not trouble about. Morris was always advocating the necessity for artists to become as good craftsmen as possible; if we cannot be good craftsmen in one line, to go down to the next, find our level in the arts, and be good in that; for, if we are artists at all, we shall be sure to find out what we can do well, even if we cannot do it easily. The aim of this great art reformer was to make art again the heritage of the people, to bring the craftsman and the artist together, and to make man's work no longer a toil for him. These are points upon which Mr. Walter Crane and Mr. Lewis F. Day have been discussing in a little volume entitled "Moot Points: Friendly Disputes upon Art and Industry," which deserves the perusal of all who have the interest of those pursuits at heart, published by Mr. T. Batsford.

"The Ideal Artist" is the title of the preliminary discussion, or dialogue. The first question turns on the vulgar and commercial in art, and it is to the meaning of these terms the disputants direct their attention. Mr. Walter Crane affirms that these characteristics are "quite antithetical to the artistic spirit." Of the meaning ordinarily attached to these terms there can be little doubt, though the disputants bring in side issues, which obscure the real question. We are not always sure that the terms are used exactly in the same sense. Mr. Lewis F. Day admits that vulgarity vitiates art; but doubts how we can "fairly deny the title of art to a good deal which is certainly vulgar," and he instances a comic artist, well known, who, though vulgar in his choice of subjects, was, nevertheless, an artist. Mr. Walter Crane rejoins by distinguishing between "vulgarity of treatment and vulgarity of subject." He truly says, "An artist in characterisation may make refined studies of common objects." The objects may be vulgar, but his characterisation of them is not so necessarily, and he instances Charles Keene, who drew vulgar types with astonishing artistic precision. There is a good deal to be said in favour of this distinction between treatment and subject. One man may idealise a common or vulgar object, and by so doing he lifts it to a higher plane, and may make it artistic. Even a wall paper can be made vulgar by representing human figures and animals, or other common objects, or a very naturalistic treatment of flowers or fruit, a common or vulgar type. Vulgarity and commercialism are to some extent in art at least synonymous. We all know that popular representations are generally imitative or natural. The average man and woman like their vases and objects of use covered by animal or floral devices or made to imitate some grotesque creature. These are

more popular with the lower orders of culture. Spencer has said truly that primitive man delights in objects that copy animals or natural forms. And something depends on the personality or mind of the artist. He may give a character to his object even if common, which removes it from the reproach of being vulgar. "L. F. D." thinks Versailles vulgar "in all its gilded glory," though Le Brun and his compeers were artists. We cannot admit the charge of vulgarity against the style of Louis XIV. at that palace; it is gorgeous and luxurious if we will, but hardly vulgar, and as Mr. Crane says, "style may redeem even pomposity and display" by raising it above the popular and catchpenny motive. The same writer says "the vulgarity of Louis XIV. decoration—if it is vulgarity—is almost refinement compared with some modern excesses." From the discussion on this question, there are evidently two conceptions of vulgarity, though both appear to admit there is some quality of mind or treatment which raises even a vulgar type to a higher level than it would otherwise have. Both of the combatants admit that style may redeem a vulgar style in such a manner that it may be called art; but they are not agreed as to the exact meaning to be attached to the word. The nearest approach to the definition is that vulgarity is a form of "modern commercial pictorial art, which is consciously catchpenny." The argument then turns to another issue—the motive of the artist. One of the disputants, Mr. Day, says: "An artist works to live"; the other, Mr. Crane, says: "No; an artist lives to work." Here the question of "commercialism" comes in. One argues that it is only when the artist thinks too much of money that it soils his artistic soul; the other thinks the money question has nothing to do with art. It is a nice point, but it does not appear to have anything to do with vulgarity as a positive quality in art. The disputants, indeed, appear to be arguing in a vicious circle when one interprets "vulgarity in art as the lack of that natural refinement or acquired culture which lifts it above the common," and the other that "what is common is not necessarily vulgar." A concrete case is presented by "L. F. D." He supposes a design for a carpet, in which cast shadows throw the ornament into strong relief, and he calls this vulgar. But if the composition were perfect, the drawing masterly, and the colour harmonious, he would not deny that the design was an artist's. "W. C." in reply, says if such a combination of good and bad qualities occurred in a design, he would say parts of it were excellent: the part that would make it "vulgar for you would make it in-artistic for me." Both these artists admit that taste is inseparable from art—art without taste becomes craft, taste is the essence of art. Commercialism is another point. "W. C." says "I mean by it simply that a man in his work thinks solely of profit-making, but "L. F. D." replies, "No artist thinks solely of profit-making." We may here quote. "W. C." says: "I do not think (commerce and commercialism) has any real connection with art. An artist, of course, may be, and indeed must be 'commercially competent' in the sense of being able to meet industrial conditions in designing to fix a value on his work; but profit-making is a separate business." "L. F. D.": "I don't see that. What is the difference between the profit an artist makes out of his invention, and that which a manufacturer makes out of his foresight, knowledge, and initiative?" "W. C." responds: "There is all the difference in the world between the profit of a manufacturer and the fee of an artist. The former runs a business with the object of making a profit. The latter is content to get a fair remuneration for his handiwork." The typical modern manufacturer only cares to produce what the public will buy; he only cares to

produce for profit and to sell. The artist is in a different position: he does not produce for profit; he only asks for a remuneration to live his life. The result of the discussion on this point does not lead to a definite conclusion if it clears the air. One view is that artists do not work for love of art practically, if they do so theoretically—money or profit is the chief object; while the other stoutly denies this assumption, but admits that artists "are all tied to the triumph car of commerce, and are more or less slaves of the financier and capitalist,"—an idea that is cleverly caricatured in a pen and ink sketch as a vignette at the conclusion of this discussion. Of course both disputants allow that the commercial may become extreme and fatal to the artistic, one compares the alliance to a *mariage de convenance* "When commercialism peeps in at the door, art is apt to fly out of the window." A perhaps more important discussion for all interested in architecture and the Arts and Crafts is that under the title of "Designer and Executant." We have so often taken up this question that we may be excused if we summarise only the various positions taken up by the disputants. One of them protests against the theory that every artist should carry out what he designs, and every workman design what he executes, while he admits that design should be adapted to its material, and executed with feeling. He does not see, however, that either of these depends upon the designer and executant being one. The designer can gain a good deal by seeing the work done in the workshop. The advocate of the union of designer and craftsman (Mr. Walter Crane) asserts, on the other side, that a designer is all the better for a first-hand acquaintance with the conditions and limitations of the work he is designing, and for this purpose he must actually work out his own design; but he is careful to say that the artist who executed his own designs under present conditions could not pay his rent and taxes. Economics come in again here. While one view is that the designer is better for carrying out his own work, the other view is that it is undesirable in many cases that one man should do both, for imaginative artists are not all good workers, and able workmen not all gifted with invention. Commercialism also has something to do with the present separation of designer and craftsman. The latter argument is, of course, a good one, and both Mr. Lewis F. Day and Mr. Walter Crane concede this fact. The former says he is not attacking the Arts and Crafts, whose aim is to bring together art and craftsmanship, "but only the policy of those who go beyond that, and argue from the undue subdivisions of labour that there should be no division of work according to capacity." It is admitted on both sides that the combination of design and handicraft has infused new life into commercial crafts that had got deep into "trade ruts." Painting, of course, stands by itself: the work cannot be delegated to other hands, but with a decorator or designer it is not the same. Mr. Crane's view of the ideal way of working in the crafts is the right one—viz., that of the workshop system—"a designer working with assistants whom he trains and inspires, and from whom are developed fresh designers from time to time who learn every detail of the craft. Some crafts depend more upon individual expression than others. Every designer should be able to discover the craft in which he can find himself the most." Of course, the argument used by the advocates of ordinary commercial art is that it is waste of time and energy for a man of invention and design to do the common manual labour which others can do better; but it is contended by the artist-craftsman that brains and hands cannot be separated: "one's brains should be at the ends of the fingers" as well as in the head. The discussion at this point turns on the question of the separation of

brains and hands; one arguing that it is not a device of industrialism, but a work of nature, and the other maintaining that the actual separation of brains and hands in modern manufacture, accompanied with mechanical and trade finish, has been the cause of the decline of art in industry. Designers have not always or often an executive faculty, but they ought to have such a practical grasp of the design as to know how it should be carried out, and the best artists have this dual faculty by being able to realise in concrete form their idea. It is very true that the "trade finish" of the manufacturer is made too much an end by itself, one of the charges the late Mr. Morris brought against art of this sort: highly polished surfaces of metal and glass, smoothness and evenness in brickwork, mechanical division, as in jointing and ornament, are examples of what we mean. The real artist would not care to finish every part of his work to the same degree of excellence; he would make allowance for material, position of the eye, texture, and other points. The question of subdivision of labour has a relation to this subject. The industrial artist must to a large extent depend on subdivision of labour in the production of his design; on the other hand, the artist-craftsman does not say there should be no subdivision of labour, but thinks it should be limited to certain classes of work, or where there is different kinds of mechanical labour. In the workshop system of training the art-craftsman there is room for co-operation, and the designers and craftsmen can differentiate their talents; in fact, there is an opportunity given to each to co-operate in the production. In some crafts, architectural design is one of them, involving repetition and heavy labour, subdivision is necessary; in others—i.e., painting, modelling, metalwork, colouring, &c., the designer and craftsman are better united. The conclusion of this discussion is that the question "depends on the sort of design, how far it is essential that design and execution should be in the same hands." Both the disputants to this question appear to agree that in some crafts, like painting, modelling, metalwork, carving, and many more, the designer should, if possible, be his own executant. That he ought to be in all cases may be a sound theoretical view; but economic conditions render it impossible. If we take only modelling, the two functions design and execution are indissolubly one. The artist who cannot express his idea in modelling, in giving form and solidity to his thoughts, can have very inadequately mastered his theme. He cannot, for instance, realise the light and shade—one of the elements of a group of sculpture or a modelled design, or the effect of perspective. Nor in a design for metalwork can he fairly do justice to the design and detail unless he can give the effect of hammering and texture to the metal. In such a manner did Vischer and his colleagues in German metalwork attain their pre-eminence as craftsmen in bronze, copper, and iron in the fifteenth century. A clever caricature, intended to symbolise the attempt to unite art and industry, called "A Day-sy Chain," embellishes the end of this chapter. "The Artist and His Livelihood" forms the subject of another colloquy; but pressure of space will only permit us here to give briefly the main points of the controversy.

The question is a large one, with many issues. It concerns the present commercial system, which is a fruitful source of controversy. On one side it is alleged against it that it is responsible for our overcrowded market, competition among producers which encourages "insincere and cheap penny productions in art," to use Mr. Walter Crane's phrase; also a narrow kind of specialism into which capable artists are forced in order to live. On the other side these charges are more or less disputed. Both sides agree that competition and overcrowded markets are evils; but it is alleged by the commercial artist

that it is no misfortune to the artist that he has to earn his living. Mr. Walter Crane puts his objection in the right form—that it is the effort to sell that is objectionable, and has no relation to art. "It is rarely that which sells which is nearest to the artist's heart, and therefore it is difficult to be at once commercial and sincere in art." The artist produces for the joy of producing and giving pleasure, not for profit. On the other side, the argument of Mr. L. F. Day is that the artist thus sets up a standard of life and shuns his duty as a citizen. He does not think art gains by repudiating the commercial. There is something to be said on this side of the case; but every man has a right in the community to do the work he is fit for and can do best, not to allow his time and energy to be divided by a desire to get a living. The man who has to study and cater for the market of public taste, or for what pays best, must sacrifice his art. It is also true that the artist who is a specialist, strictly with a view to commercial success, loses in time his power of doing the one thing for which he has equipped himself well. Often a man goes in for a work that pays him best, though his real power is in another direction. Thus, a man who designs wallpapers might do better work in mural painting or stained glass. As "W. C." says, "It is an age of round men in square holes," but the holes are waiting to be filled, and artists are in readiness to rush in. There is little choice—their work is cut out for them as a rule. Supply creates demand, and an artist has to make his living, and he has to design to suit the market. But "the industrial artist" says, opposition to degrading conditions braces the artist; that what is forced upon the unwilling artist under present conditions to make a living improves the artist. We cannot expect ideal conditions, and therefore our efforts to do the best is good for both; the necessity of earning a living is said to be a good thing for the artist. So this long discussion proceeds. One of the combatants argues we are living in a vitiated atmosphere, our conditions are not favourable to art, and the true artist, if he is honest to himself, must fail to earn a decent living. On the one side the commercial advocate says the necessity of doing work not in itself attractive makes for character. He denies that a designer must degrade his art or starve;—he can "meet the demands of trade in a way that is not degrading—which makes a better man of him and no worse artist." The disputants "beat about the bush" a great deal; they seem to be discussing the subject from opposite points of view. What are the strict conditions of the artist and commerce? To one they appear degrading to the artist to have to submit to them for the sake of making a marketable article; to the other, they are regarded as meeting wants. Both are agreed that the artist must meet conditions. Then the terms "degrading" and "artists" appear to be viewed differently. To the industrial advocate degradation means working on a lower plane, to the ideal artist doing something to please a vulgar taste or market. The word "artist" is taken to mean the actual artist "as he is" in one sense; the other as the "worker" in art. The conclusion of the discussion appears to be summed up in "W. C.'s" last reply. It is better for all to earn their living, for each to serve the community according to his capacity. "He who lives to please must please to live, and here the unfortunate part of it comes in under present economic conditions as regards the artist: hence insincerity, banality, and pot boilers."

The next colloquy is on Art and Industry, and turns on the question of the division of labour. The advocate of the Arts and Crafts movement asserts that it is one which actually unites the two, that it is an attack upon a commercial or capitalistic

organisation of industry. The other side disputes this statement, and "L. F. D." says, "industry may have gone astray, but yours is not the way to bring it back to the path of art." We have no space to enter into the questions raised, though exceedingly interesting. The advocates of the industrial order of things have little faith in "a handful of independent workers" setting up a new system. On the other side it is admitted that no sudden change of the factory system and machine production for profit into artistic production for use is at all likely, nevertheless, the artist-craftsmen's ideas are influencing industry. "W. C." very truly observes, that to obtain a really artistic thing, however simple, it is necessary to return to handwork. The discussion turns largely on the use of machinery, and how it has benefited trade at the expense of art. While the advocate of industrialism, as it is, regards profit as the main motive of production, the Art Craftsman makes *use* as the chief incentive; but we cannot follow the subject further now. The other discussions, also of much interest deal with "Work and Pleasure," "The Profession of Art," and "Poetic Ornament." We may return to them on another occasion. In the mean time, we may congratulate the authors of "Moot Points" upon their interesting and instructive contribution to the cause of art, and the friendly spirit in which the discussions have been conducted. This work places the general art reader in a position to judge for himself the merits of the two schools which just now divide the artistic world upon the great questions of Commercialism and Craftsmanship.

ON THE PLANNING OF SMALL PUBLIC LIBRARIES.

By A PUBLIC LIBRARIAN.

DURING the months August to November there have been recorded (excluding amounts over £10,000 and under £1,500) gifts from Mr. Carnegie to one hundred localities for the erection of public libraries amounting in all to £380,000, or an average of £3,800 each. It is well known that every large town has now its public library, and, excepting additions to existing buildings, the provision of branches, and, in a very few cases, the erection of a new central library, the designing of public library buildings has of late been—and is likely to be in the future—confined to those of small towns, the cost of which will be from £1,500 to £7,000.

It goes without saying that the architect's work is governed more or less by local conditions of site, peculiar requirements, &c., nor forgetting the fact that the constitutional prejudice of Councillor Sloman, of Muddleton Magna, rules out anything that has not been tried at Puddleton Parva, his native place, and in whose library he first acquired a love of reading.

It is impossible to dogmatise on the planning of a public library; in fact, this paper would be unnecessary if the architect had the benefit of an hour's discussion with a trained librarian who was alive to the special local needs and modern developments of library practice; but in the preliminary arrangements the schedule of accommodation is too often drafted by the members of the council, with, perhaps, the assistance of the borough surveyor, after paying a visit to two or three libraries in their vicinity.

Before an architect can successfully plan a public library he must know something of its economy, and this knowledge can only be obtained of a librarian. One of the most important considerations is, strange to say, invariably lost sight of by architects. Designs for a public library to cost, say, £6,000 are invited. The architect finds on inquiry that the population of the town is, say, 40,000, and that there are 5,000 volumes in the exist-

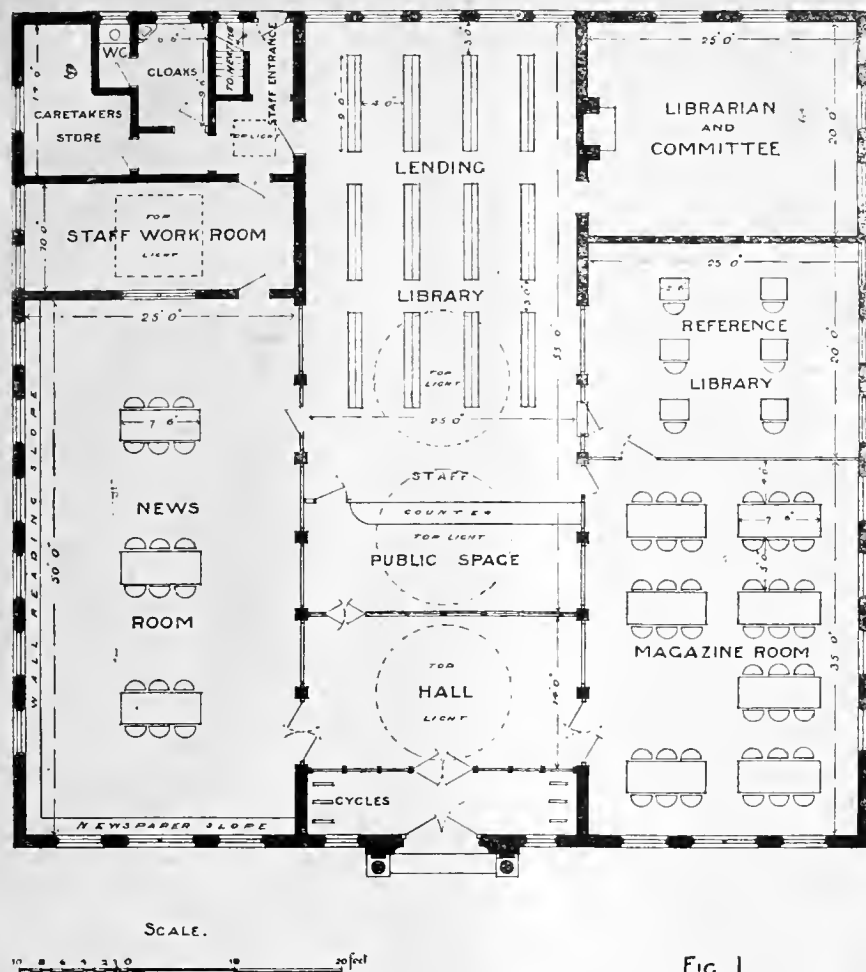

FIG. 1

ing building, the annual issue of books being about 50,000. Thinking the arrangements of libraries four times the size will be of little or no help to him, he selects three towns with about the same population, so that he may see the actual working of such a library as is likely to be required. The library rate of 1d. in the £ in those towns he selects may produce, say, (A) £400; (B) £800; (C) £1,200; owing to differences in the local rateable values. This question of income is of very great importance, as it generally makes a difference in the composition of the library staff.

Let us take for illustration three places about to erect a public library. If some seemingly superfluous matters are dealt with, our excuse is that recent experience in assessing public library designs has shown us that architects have given very little attention to library management. This is seen not so much in their designs as in their inquiries. It must always be kept in mind that we do not draw any hard and fast lines in what follows.

In the first place, we would like to show approximately the probable income and work of the libraries about to be built. The following comparative table is based on an examination of the small libraries now established.

Library to cost in building	£2,000	£4,000	£6,000
Population	8,000	20,000	40,000
Annual income	£140	£400	£550
Volumes in library at opening	500	2,000	5,000
Ultimate maximum number of volumes in lending library	4,000	8,000	12,000
Ultimate maximum number of volumes in reference library	200	500	1,000
Daily issue of books	50	120	200

It is difficult to say how (d) would be staffed, as so much depends on local conditions; but it is almost certain that (r) and (f) would require the same number of

attendants, therefore if (c) pays say £200 in salaries and wages out of a total income of £400, there is considerably more money at (f's) disposal for books, newspapers, and reviews. This affects the accommodation required. These are points to be considered at the present time, as the prospect of localities taxing themselves to maintain libraries adequately is still very remote.

The nature of the site must, of course, largely affect the design; but in the case of the libraries now under consideration, the site seldom causes any difficulty, as open spaces need not be so jealously guarded as in the larger towns.

Fig. 1 is by no means intended as a finished plan, but merely to indicate the accommodation required in a library costing £6,000.

The lending library is arranged on the ordinary method of service with an "indicator" on the counter, but should it be decided to adopt the "open access" system, a system more likely to be generally adopted as its advantages become more known, it would only be necessary to utilise the space now given to the public, and to place three book stacks where there are now four, the three displaced coming forward. It is of the greatest importance that all shelves should be of the same length, so that they may be interchangeable throughout. The shelves should, of course, be adjustable, either by means of the well-known Tonks fittings, or some other mechanical contrivance. In estimating the storage capacity of the library, allow eight shelves to each standard stack 7ft. 6in. high (never higher), and ten volumes per lineal foot. This is a very slight over-estimate, but it is practical and near enough, unless the library has already a large collection of old quartos and folios.

Many libraries now organise courses of lectures, and this tendency to link the public library to such movements as University Extension, National Home Reading Union, &c., is growing; and as it would be very

wasteful to build a special lecture-hall, it is advisable to provide roller shutters to cut off the magazine and reference room from the rest of the library when these rooms have been temporarily converted into a lecture-room or classroom. The news-room is large enough to take the displaced furniture during the lecture. The staff workroom is a great convenience for repairing books, filing papers, unpacking cases, &c. The floors of all public rooms should be laid with hard-wood blocks

FIG. 2

and the hall with mosaic. Tiles are too noisy for a library. Glass screens should be used to separate rooms, so as to facilitate oversight. If it is possible to obtain a supply of electricity for lighting, this method of lighting must be adopted, as it is the only satisfactory one. Gas ruins the bindings of the books, and vitiates the air. The extra cost of electricity is balanced by the saving in cleaning and rebinding.

Ventilation still seems to baffle all architects, as a visit to any public news-room on a damp muggy day will prove. The fresh air inlets should be arranged near radiators, and wherever possible (particularly in the poorer districts) an electric fan should be placed in the roof of the news-room.

Newspapers are better on wall slopes than on detached reading desks, as they distribute the readers and admit of easier supervision. Another small matter, but one that largely affects the work of the staff, is the provision of back or side doors to allow the carrying of books to the open for dusting. This necessary work goes on throughout the year, and is often hampered for want of convenient side doors.

The designing of branch libraries need not differ materially from that of any small town library, save in respect to the storage of books. No branch need house more than 10,000 volumes; in fact, 5,000 should be nearer the number stored, as books not frequently called for should be either discarded or transferred to the central library. It will be noticed that neither special room for ladies has been provided, nor public lavatory. The latter is really unnecessary, and where it has been provided has proved an abomination. As to the former, it seems somewhat surprising that the thought of providing such a room should ever be entertained. The sexes mix in church, in the theatre, in museums and art galleries, therefore there is no logical reason for separation in the public library. A more cogent reason for not having such a room is that a library should be, as far as ever possible, educational, and the provision of such papers as those specially published for women should certainly be reduced to a minimum in an educational institution, and it is impossible and unnecessary to supply duplicates of the standard periodicals.

Now, with regard to libraries costing £4,000 and £2,000 (the sketch herewith shows what is likely to be required in a library costing £2,000), with a normal income, and after what has been said, it seems unnecessary to give a middle sketch, as something between the two will meet most cases.

Local committees generally wish to make the reading-rooms of small libraries look comfortable by providing open fires, and in this matter architects seldom go against the wishes of their clients, as this method of heating offers more opportunities for pleasing effect than an arrangement of hot-water pipes. The open fires cannot be too strongly condemned, as they cause infinite dirt, and their heating powers are satisfactory only to those genteel and other loafers who think "self's the man." An open fire may be provided in the librarian's room and the staff workroom, but the whole of the library should be heated with radiators on the low-pressure hot-water system.

Whatever style may be adopted for the elevation, ample natural light should be admitted. The mental impression made on the reader by the stones may be more elevating than that he receives from his reading, but a style of architecture shutting out the daylight from a public library is bad.

RATING.*

THE principles and practice of Rating, from the surveyor's standpoint, have not received the attention their importance deserve, and we therefore welcome the bulky volume on the subject, by Mr. Philip Michael Faraday, Rating Surveyor, which presents the subject clearly and intelligibly to practical men and others. The principles which underlie rating assessment are divided from the practice or form which they take before rating authorities, a plan which has many advantages. The new edition (this being the second) has been considerably enlarged, and several important legal decisions have been embodied. The recommendations of the Royal Commission on Local Taxation are not likely soon to become law, and perhaps this is not regrettable, though the evidence given is of great value, and should lead to many reforms in practical procedure. The author has been assisted by Mr. A. F. Vulliamy (a solicitor of the Supreme Court, and many years clerk to the Guardians of the Ipswich Union and to their Assessment Committee), who has edited the legal part of the work. The principles of Rating form Part I. of the book, and six chapters are devoted to their exposition. As our readers may not be aware, the foundation of the present law of rating dates from an Act 43 Elizabeth c. 2, which gave power to the parishioners to elect a certain number of householders in that parish, and, "together with the churchwardens of that parish, they shall become the guardians of the poor." There are many exemptions by statute and common law: such as all Crown property, palaces, galls, post-offices, barracks, volunteer storehouses, drill-halls, bridges in occupation of the Crown, police-stations, courts of law, churches and chapels, literary societies, public libraries, parks, &c. Chapter III. deals with Occupation, an important point as to the question, Who is liable to be assessed to the Poor Rate? It matters little under what tenure the property is held so that there is an occupation. Possession does not necessarily imply occupation, and in the case of "R. v. St. Pancras," Lush, J., said: "Occupation includes possession as its primary element, but it also includes something more. Legal possession does not of itself constitute an occupation. The owner of a vacant house is in possession, and may maintain trespass against anyone who invades it; but as long as he leaves it vacant he is not rateable for it as an occupier." There must also be exclusive occupation to become liable to be rated to the Poor Rate; an ease-

ment is not rateable, and as in the case of "Smith v. Lambeth Assessment Committee" bookstalls on the platform of a railway station were held not rateable, as there was no exclusive occupation of the newsagent of any portion of the platforms; but the bookstall, enhancing the value of the station, renders the railway company liable. This rating was confirmed in other cases, as when stables were let within the railway company's premises and the company were held rateable. Many important instances are cited. Lodgers are not considered occupiers, for a lodger occupies only a portion of a house, and has not exclusive occupation. (See "Allan v. Liverpool.") "In the case of a lodger his occupation is more in the nature of a guest at an hotel: his rooms are entered by the landlord for the purpose of keeping them clean and in order, &c.; he uses the same staircase, and his apartments are under the control of the landlord. This cannot be called exclusive occupation which would make him personally liable to be rated for that portion of a house used by him." Cockburn, C.J., made the occupation to depend on "whether the landlord retains the control of the outer door." The case is altered when the house is divided, the upper half let to one tenant and the lower half to another. Lord Esher gave a sound judgment in this instance. It was argued that because there is no structural division of the house, the occupation of each part of the house is to be treated as a joint occupation; but this was not upheld. The judge contended that the occupation must be dealt with. Each of these persons occupies rooms in one floor of the house, and occupies them separately. Nobody else has a right to interfere with his occupation of that part, and they are each to be rated in respect of their occupation. It is a misuse of terms to say they jointly occupy this house. Each man or lodger occupies something, and whatever you may call it he is liable to be rated. The question of flats and chambers is of interest. In the case of "R. v. St. George's Union," where the blocks were structurally divided into 117 different sets of rooms, and capable of being let and occupied separately as residences or offices, Cockburn argued that every one of the occupiers of these distinct tenements (117 in number) is rateable to the Poor Rate, and to other rates to which occupiers are liable. Other interesting instances are given. The phrases, "gross value" and "rateable value," are defined. The method of taxation was very irregular at first: there was no uniform rule for levying the rate, the overseer had to make the assessment, without any guide as to the capabilities of the ratepayer. In 1743 the churchwardens and overseers had unlimited power, and often misused their authority, and the Poor Rate Act of that year met this evil. Many doubts arose about the meaning of the terms "gross value" and "rateable value." They were defined by the Valuation (Metropolis) Act, 1869, the former as the "annual rent which a tenant might reasonably be expected, taking one year with another, to pay for an hereditament if the tenant undertook to pay all usual tenant's rates and taxes, and tithe commutation rentcharge, if any; and if the landlord undertook to bear the cost of the repairs, insurance, and other repairs, if any, necessary to maintain the property in a state to command that rent"; and the latter term, "the rateable value of any property as the gross value, after deducting from it the probable annual average cost of repairs, insurance, and other expenses, if any, necessary to maintain the property in a state to command the rent." These definitions are in force at the present time. The author justly remarks: "There is, no doubt, some modification required in the definition of 'gross value,' as in the year 1891, when the Tithe Act came into operation, it was enacted that the landlord, and not the tenant, should pay

the tithe; whereas it is assumed in the definition that the tenant pays it. The consequence is that a landlord who formerly received a rent from a tenant, who himself paid the tithe, now has to increase his rent to a figure which will leave him, by way of profit, the same amount as before. The result will be seen at once—the former rateable value will remain the same, because, as the tithe is rateable, the landlord pays the rates on it, and in the event of the rateability of the property being increased, owing to the raising of the rent through the circumstance stated above, not only will the landlord pay the rates on the tithe, but the tenant also, an injustice which cannot have been contemplated by Parliament when passing the Act." Of course, present value must always be the basis upon which a property is to be assessed. In London the valuation list is made once in five years, and for practical purposes this is sufficient, as the fluctuation in value does not occur often, except, perhaps, in case of companies.

The chapter dealing with public companies discusses the principles of rating as applied to these bodies. To find out the rental value of a company is difficult. A powerful company can effectually resist the claims of a poor parish. The basis of assessment must be the receipts and expenses. In arriving at a fair and equitable figure, the rental value of the land occupied by a company has to be found, and this can only be done by examining the accounts of the company. When the company's land extends over several parishes, it is assessed at so much for each. The principles of rating as applied to canals, to railways, gas and water companies, tramway companies, telephone and electric light companies, &c., are also discussed. One question has been to determine the principle of assessment for railways: the parochial principle is the one adopted in making a valuation; the other principle is based on mileage. The difficulty of applying the parochial principle to a gas or water company is pointed out by means of diagrams. A railway or tramway company earns money in every parish it passes through, irrespective of when the money is collected at a station beyond; but with a gas company which makes "the gas at the works A, conveys it through a parish C, and sells it to a consumer beyond at B, it is at B the money is earned, and the parish authorities of C can only assess the main in their parish in a percentage upon the structural value of that main." In a third case, when the gas is conveyed from works A through mains to parishes C and B, it is shown that the intermediate parish C has two sets of mains, one supplying the consumers in that parish, another set carrying the gas beyond to parish B. These two sets of mains, "live" and "dead," have to be rated separately. In practice the valuation is made of the whole undertaking, deducting the value of the "dead" works—i.e., the manufacturing works, dead mains, or reservoirs (whichever it is, gas or water). The value of the dead works and mains is subtracted; the result is the rateable value of the entire live works. Then the actual receipts in the parish in question are obtained, and a simple proportion sum is made thus:—"As the whole receipts are to the rateable value of the whole, so are the receipts in the parish to the rateable value of the parish." A percentage value of the "dead mains" in the parish must be added to make the valuation complete. Each parish must therefore rate the part that lies within it. The same principle of assessment is applied to telephone and electric-light companies. Machinery is the next subject discussed, but we pass on to the practical part of the volume dealing with Buildings. These include houses, small tenements, public houses, schools, shops, theatres, hospitals, convalescent homes, asylums, hotels, &c. We can only dwell here upon

* Rating: Principles, Practice, Procedure. Second Edition. By PHILIP MICHAEL FARADAY, Rating Surveyor; the legal matter revised by A. F. VULLIAMY, a Solicitor of the Supreme Court. London: Estates Gazette, Ltd., 6, St. Bride-street; Sweet and Maxwell, Ltd., 3, Chancery-lane.

houses as the most frequent description of property, and we may refer to the third schedule of the Valuation (Metropolis) Act, 1869, where there is a maximum rate of deduction from the gross value or rental value to arrive at the rateable value. Three classes of houses and buildings are liable to Inhabited House Duty, and those, with the reductions allowed by the Act are worth giving for reference. Class I. comprises houses and buildings, or either of them, without land other than gardens when the gross value is under £20. For these the maximum rate of deductions per cent. is 25 or one-fourth; Class II., ditto, ditto, when the gross value is £20 and under £40, 20 or one-fifth; Class III., ditto, ditto, when the gross value is £40 or upwards, 16²/₃ or one-sixth. The most simple case of assessment is when a tenant occupies a dwelling-house at a rent of £19, the landlord doing the repairs and paying the insurance: in this case the gross value would be £19. Then under this schedule Class I., the maximum deduction must not be more than £4 15s. This would be £4 10s. for the repair and renewal fund and 5s. for insurance, leaving £14 5s. rateable value. If the tenant paid all the repairs and insurance expenses, the rateable value would be the rent actually paid, £19, less a small amount for sinking fund. In another instance, if a tenant takes a house at a yearly rental of £39, the landlord doing repairs and paying insurance; from the gross rent would be deducted under the schedule Class II., one-fifth, or £7 16s., leaving £31 4s. rateable value. Other examples are given, where the tenant undertakes the repairs, and a concise rule is given to ascertain the rateable value, which, with the aid of the tables given for Classes I. and II., will enable anyone to find the rateable value. But the subject is too large to consider here in its various bearings, and we may leave the volume at this point, hoping to refer to other classes of buildings mentioned. Mr. Faraday has given us a very useful and comprehensive handbook, with complete tables of cases, with chapters on the procedure inside and outside the Metropolitan area, with forms and appendices of the leading Acts of Parliament relating to the subject.

THE ARCHITECTURAL ASSOCIATION.

THE sixth ordinary meeting for the present session was held at 9, Conduit-street, W., on Friday evening, Mr. Arnold B. Mitchell, B.A., Vice-President, in the chair. Messrs. A. W. Wilson, C. W. Bury, H. J. West, H. Bromley, and R. Welford were elected as members. The chairman announced the following additions to the New Premises Fund:—Messrs. Farmer and Brindley, £10 10s.; Mr. T. E. Pryce, £10 10s.; and Mr. E. R. Howard, 10s. 6d. Mr. Louis Ambler, hon. secretary, stated that a joint meeting of the Discussion Section and the Camera and Cycle Section would be held on Wednesday, January 6, at 7.30 p.m., when Mr. F. Lishman would read a paper on "Sketching from an Architectural Point of View," and Mr. Gilbert H. Lovegrove would read one on "Photography." He also announced that the following classes were about to commence:—Jan. 6, Elementary Physics, Div. I., lecturer Mr. H. B. Ransom; Jan. 7, Drainage and Water Supply, Div. II., Mr. Max Clarke; Jan. 13, Ornament and Colour Decoration, Mr. Cole A. Adams; and Jan. 14 Greek and Roman, Div. I., Mr. Hugh Stannus.

OLD STUCCO-DURO AND PLASTER WORK WITH REFERENCE TO MODERN USE AND APPLICATION.

A paper on this subject was read by Mr. G. P. BANKART. The very commonness of the material, its cheapness, and facility of manipulation are, he remarked, at one and the same time the virtue and the misfortune of plaster. It combines extreme ease of manipulation with great durability. To no other material do the associations of our daily lives cling more closely than to the plaster with which the very walls and ceilings of our homesteads are covered. It is this very serviceableness, this very commonness, which may

make it worth the while of some of us to pause over, to consider what has been done with it—what is being done with it—what may be done with it—what are its possibilities and limitations as a material. It is intensely sympathetic, a medium which has been used by some of the world's greatest artists of all times but the present, and yet of all the materials in the employment of men few, if any, have been subjected to greater vulgarity of treatment than the plaster of the last century. It can be modelled, it can be cast or incised, coloured, stencilled, or stamped with equal freedom, from the size of a cameo to the vastness of a dome. It may be set as a jewel or applied to the façade of a palace. We propose to treat on some of the methods of working it when it was an art in order that we may better realise its capabilities and limitations for the present and the future. Having sketched in some detail the historical use of stucco, Mr. Bankart pointed out that plaster was a much more recent invention.

ITALIAN WORKERS IN ENGLAND.

The introduction of Italian workmanship into England in the reign of Henry VIII. was followed by the raising of a school of English craftsmanship which rapidly spread the art throughout the country. But stucco-duro gradually gave way to the employment of coarser stuff or "parget" work, which became rather later the medium of the native workmen. About 1547 we have record of an English stuccoist named Chas. Williams, who had travelled in Italy, and probably was the first to work in England and at Nonesuch. Time went on, and a cheaper and commoner material brought "degeneration" with it—of a kind. This coarser stuff was modelled and stamped, and was known as "pargetting," and consisted of the ordinary lime, hair, sand, and was applied to any part of the structure, internal and external. Then followed

THE WAVE OF PLASTER WORK,

particularly our own:—1. The arrangement of panelling and radiating ribs based on the fan tracery of stone. 2. A pendentive system superseded and outlived the above, as at Andley End, in the "Fish Room." 3. Modelled foliage sometimes replaced the radial ribs, giving effect of Gothic diaper. 4. Pendentive system superseded by geometrical arrangement of ribs—not limited to straight lines, ceilings abounding in interlacing lozenges, quatrefoils, circles, ovals, and other forms, spaces between ribs being filled with armorial bearings and personal devices and other emblematical forms; figures very seldom, unless of armorial character. (5) Size of sub-division gradually expanded until (6) Ceiling area became divided into four parts large or small, quarter bearing the design. This developed into

THE JACOBINE SYSTEM

of interlacing strapwork and patterns. Earlier ceilings had plain moulded ribs—like groin ribs. As power of execution grew flat surfaces became introduced between two sets of mouldings, with improved decorations done off a revolving stamp. Queen Bess's time had moulded ribs, with sprays or sprigs of flowers or medallions of floral ornament. These ribs or medallions were cast or run *in situ*. Sprays and medallions in early days were nearly always modelled by hand. Afterwards stamped; later still, cast in plaster of Paris. Sometimes sprigs were butter-pressed. In later years, methods were almost exclusively confined to casting in plaster of Paris. This system was productive of a beautiful softness and dulness suitable to the material, and was quickly done compared with earlier methods, and stucco-work, and less expensive. Against this one has to put the sacrifice of intellectual effort on the part of the worker.

WHAT DO WE LEARN FROM THE OLD WORK?

The plaster is widely different from ours. Examine a piece of old plaster. It is coarse and rough, and contains little bits of gravel and other inequalities which modern architects would condemn without doubt. Where should we draw the line? The old ceilings were not die-level and polished: they were full of delightful, but very slight, undulations; the ribs and strapwork were not painfully exact, as ours are. The old work lacks that strain and mental limit naturally associated with office confinement, and the ever continual abuse of drawing as an art instead of a means to an end. Hand and eye judgment, rather than exact measurement, was evident everywhere. Moulds were carried from one job to another, and frequently made to fit in as they would, or were

altered to suit circumstances. The workmen had their moulds, tools, and traditions—perhaps some rough plan for guidance, instead of a fussy and pretty drawing of what it would not, and could not, look like—to tempt and deceive a client. All sorts of funny things occurred, quips and cranks and things attributed by some to the genius of the age, and which were very possibly due to accident. Ornament designed and worked for a ceiling will be found combined with another, and used as a frieze elsewhere, or into an interlacing pattern in some lunette. All sorts of things done for one, or several places, are combined in an overmantel or wall space between dado and ceiling. Much modelling was done with metal tools, and sometimes with the fingers and hand. The lime must have been in a very different condition when used in those days to what it is now, or men's fingers could never have worked it! In many ways their methods of procedure were different from ours—more intellectual, less mechanical. Think of the many quaint patterns done on the outsides of buildings (cottages and houses) by the common village plasterer or mason, with the pointed "fan" of sticks, still used by our own plasterers for "pricking-up," as they term it. Think of the quaint patterns done with end of the trowel in various ways. These patterns are confined to the particular district radius in which the man lived and worked. Some of this "pargetting" work is not only clever, but complicated, in the arrangement of symmetrical, flat, strapwork patterns, in panels sometimes, at other times over the whole surface of a wall. Some of this work is suggestive of natural form, and it is here interesting to note how the influence of Nature affected this art when first introduced into England. At that time the stucco-worker undoubtedly went to Nature for inspiration, as is evidenced by the friezes at Hardwick Hall, St. Michael's Mount, and other places. This may have been because the art was new, and then had no traditions which could be followed.

SUGGESTION V. REALISM.

The plasterers' craft did not share the fate of the other crafts, whose traditions were paralysed and crushed out at the time of the great upheaval in Henry VIII.'s reign. On the other hand, it was inspired with a new use, a new life, a new purpose, and was developed with a vigour and freedom strongly akin at times to the wonderful work at Venice and the Early Gothic work. Take, for instance, one example only—the Long Gallery ceiling at Knowle, Kent, in which are combined the vine, rose, pink, honeysuckle, columbine, marigold, lily, oak, &c., &c. These flowers occupy spaces formed by waving bands of enrichment, and are modelled quite as admirably as such dull material as plaster can, or ought to, be modelled. It is very simple, broad, big, straightforward work, free in every way, has little variety of relief; the line curvature is gentle and refined, although vigorous. There are no sharp curves, no under-cuttings, or "sparkle" of effect that might be appropriate and desirable in a harder material, such as stucco, or wood, or marble, but it has a dulness and a softness quite natural in such a medium. There is no attempt to "copy" Nature, but only to give so much of her as would express the vital quality, freshness, and vigour of growth, combined with fulness and convenience of arrangement and disposition. "Realism" was admittedly beyond the limits of plaster, unnecessary, and even undesirable. With such limited means at hand the plasterer contented himself, and rightly so, too, with a mere suggestion of Nature, and compromised matters between his material and the suitability of his design to the material. Simplicity, breadth, reticence, were his watchwords, and sincerity of purpose his most faithful companion. The contrast between the past and the present is sufficiently palpable. We are now chiefly concerned with what is open to us at the present time, and this brings with it various little difficulties. Being myself an architect as well as a craftsman, I am in a position to realise both sides of the question. We cannot, if we would, get away from the employment of plaster as a material. We, therefore, are confronted with the question of what can or should, or what cannot or should not, be done with plaster work. What are its capabilities and limitations as a material? Craft degradation has gone so far that what is called "painted decoration" is done by "firms" to the order of members of our profession. Wherever handicraft has not been intercepted from material by the intervention of a learned profession, work is still as perfectly beautiful as

ever it was, be it in the windmills of the millwright, the fishing-smacks of the shipwright, or the wains of the waggon-builder—romantic with quaint chamferings, gay with bright paint. What we want are housewrights, and let who will play at examination in the art of passing examinations. Such a sympathetic and sensitive medium as plaster can be used rightly or wrongly, and from its fatal facility of handling the latter course is the more easy, and, from long habit, the more likely to be expected and the more usually demanded. We are all familiar with the modern "sugar"-confectionery of the plasterer. At the present day we have the same materials open to us as before, viz., stucco-duro—ordinary lime and sand plaster and plaster of Paris—not to mention cements of various kinds. The controlling elements are, first of all, cost, which is naturally a wise and binding consideration. Then, clients' idiosyncrasies, architects' ideals, and craftsmen's individualities—sometimes all combined! The employment of "stucco" goes hand-in-hand with freedom of thought and handling, which none can dispute. The idiosyncrasy of clients, where architects are not strong enough to influence them for the better, is hopeless and fatal. Architects' ideals are often possible, with the exercise of freedom and of individuality on the part of the craftsman, when he is a genuine craftsman.

THE CRAFTSMAN'S SYMPATHETIC HANDLING

is the last, and perhaps most hopeful, means of success, where such individuality is strong, unaffected, and reliable. Everything depends on his knowledge of, and sympathy with, architecture, his knowledge of past methods and forms; his knowledge of his material, its capabilities, and limitations; his power of imagination; his grasp of the teaching of nature; his gift of selection, and of the power of expressing himself; and his constructive instinct. Granted a full share of these qualifications, there is little to fear so far as he is allowed a reasonable amount of freedom. And here lies the hinge of the matter—a subtle hinge, to be opened and closed at will by the architect and by the client. Putting "stucco-duro" aside as undoubtedly the finest and most permanent, though more expensive, method of expression, let us resort to less expensive ones. We next have a system of modelling in clay and casting in plaster of Paris, sulphate of lime, from plaster moulds, as the case may be—either solid or fibrous. Here the craftsman has a fair chance of various nice treatments, in the placing of his enrichment, and the relief of his enrichment, according to the funds at his disposal and the liberty allowed (either of restraint or otherwise). In such manner beams may be clothed, flat spaces treated as flat spaces, with flat or projecting bands of soft enrichment in endless ways. I do not consider deeply undercut enrichment cast in plaster of Paris from gelatine moulds a practice to be encouraged. Beautiful as it is in stucco—which is a very hard material as well as a subtle one, allowing of crispness, thinness, deep modelling, and undercut relief, with beauty of texture and every other possibility—it is not a legitimate one for a soft material that is easily rubbed and broken, and will not take sharpness of treatment without injury. I admit the beauty of this type of work; but it is illegitimate, too easily injured, and unsuitable to the material. This work, of course, has to be cast in fibrous plaster, about which there appears to be much difference of opinion.

FIBROUS PLASTER,

although a modern process in this country, is by no means a modern process in itself, and many architects and craftsmen are prejudiced against it as being (1) not strictly a solid plaster process, and (2), as some imagine, not a permanent process. The first objection is a matter open to discussion for and against. The latter objection will hardly hold good, since the process appears to date back to the Egyptian Pyramids, when the mummies were wrapped up in canvas dipped in burnt gypsum. The process was introduced in England in 1859-60 from France, by a Frenchman named De Sachy. His system was to dip small pieces of canvas, about 4in. square, into the plaster of Paris, and dab them all over the mould and over each other. He employed girls in this work, but was not successful in making much of it then. In 1861 De Sachy sold the patent to Messrs. Geo. Jackson and Sons, with Mr. McDonald as foreman and instructor. But at that time little headway was made with it, and the patent was not

renewed. Smaller firms experimented with it from time to time, until it became more constructive and improved. The French used tow in the loose form, instead of the woven and open-sheet form as at the present time, with wood laths in the form of "strutting." A well-known artist told me that he disliked the system owing to having put up a ceiling thirty years ago which had rotted, and had to be taken down again. This was undoubtedly due to the use of boiled plaster instead of baked or burnt plaster. The difference in the two plasters is great, the former being soft and the latter hard. My objection to

"GELLY" MOULDING AND CASTING,

and Piece Moulding and Waste Moulding, apart from its cost, is—First, that it is an apology and cheap substitute for the work of another material—that of "stucco-duro," which would be woven into a gossamer of loveliness; second, that in the system of casting from gelatine moulds the work degenerates rapidly from the moment the model leaves the modeller's fingers. The system is unsatisfactory to begin with. The clay has to be coated with shellac instead of being cast direct from the actual clay surface. In the process of making a plaster case to receive the gelatine a layer of paper has to be laid over the modelling and a thin layer of clay over that, in the process of which the sharp edges and arrises (legitimate in a hard material, which is not afterwards touched) become doubled with the pressure of the clay, and the damage is completed afterwards by putting the gelatine out of the soft plaster casting, which must perforce suffer where fine edges exist. Apart from this, the gelatine deteriorates with every casting taken, and is greatly affected by the variation of temperature, becomes "woolly," distorted at times, and very difficult to manage, and when done is not, and cannot be, that which it is supposed to "ape," and can never take the place of stucco and its endless possibilities.

ORDINARY PLASTERWORK.

Then comes the method of dealing with the ordinary lime, sand, and hair plaster. Why should we architects allow this beautiful material to be smoother and polished up, as we so commonly know it? Why not demand of the plasterer the surface most natural to it—its own granular surface? A few words about this ordinary material, and what can be done with it in lieu of the cast work. To begin with, it is capable of being stamped, and modelled, and floated in bands, and "run," and stencilled through perforated wooden templates. The stamping process is delicious; so is the modelling when treated with breadth and simplicity. With regard to the "running" of plaster-mouldings, we are again to blame in allowing the mechanical, die-level, sharp-arrised process. It is wrong in principle, whilst we can get interesting work out of simple sections made up of soft, rounded, and wave-like forms, flat, undulating, segmental or subtle lines, natural to the "dragging" of a granular material. Again, why the inevitable and hackneyed moulded cornice across the angle of wall and ceiling? One way of avoiding the rigidity of this method of "running" where mouldings are desirable is in the working of a short piece in clay which can be slightly worked on with the fingers, and afterwards produced by casting. Of course, it is possible to work the plaster with the fingers, if the lime is old enough and sufficiently deadened, but not under present circumstances of "running" lime as it is required. Otherwise, no man's fingers could stand it! In the old work, simplicity and bigness will be found to be the root of much of its success. So, also, it must be with good modern work. I have heard it protested that simplicity is synonymous with "poverty." It may be so in some cases, where reticence and breadth are misunderstood, and texture and quality of material are lost sight of, or play a subordinate part. We have good materials at the present day, capable of good treatment. Unfortunately, the art of working them has long since been divorced from craft work, and the plasterers' craft is practically a thing of the past.

DESIGNING IN PLASTER.

Designer and worker are two distinct creatures—the one not knowing the nature of the material, the other not knowing the nature of the man whose work he is supposed to put into material, and trying to do it with a mechanical skill truly appalling in the finished result. In a material such as plaster, designer and worker should properly be one and the same person, and he must be well alive to the possibilities of his material

before he can know how to use them to advantage in a decorative sense. The strain, ever constant, of preventing the operator from obliterating the work of the thinker is horrible. If we can get a certain amount of rhythm or harmony into our work, it will be something, at least interesting—possibly mistaken—if even dull, awkward, or clumsy. Dullness is, in fact, an acceptable quality for plaster. It shows the process of workmanship, and is the natural effect of adding and pressing a soft material on to a surface of similar nature. This feeling is particularly desirable in the treatment of large, plain surfaces. You will say it will be a long time before we can expect anything different from what we are now getting from the modern journeyman plasterer. Possibly so. Possibly as long as until architects insist on having something less laboured. The remedy is not beyond us if we will undeceive ourselves, and admit other facts which I will refer to in a few moments. The kernel of the matter lies in the gulf separating designer and operator. The system is at fault, but time seems to produce reaction upon reaction, and gives some hope. This brings us to another point, and not altogether an unimportant one, and a rather delicate one, which reflects to a certain extent on our educational system and schools. Modern architects appear to be divided into two distinct schools of thought and action—the one engaged in the copying and rearrangement of the forms and lines of past styles, the other in the arrangement and the development of forms based almost entirely on simple and natural construction of materials to suit modern purposes, according to modern methods and requirements. It is a great art to be able to draw well, but it is not "design"—and it is a great gift to possess the art of "design." But before we can design naturally and beautifully in any material we must be familiar with the capabilities of the same, have served an apprenticeship with the works of the past, have held constant intercourse with them, and gather from them how and why many things were done. We must also be in touch with Nature, and pick up from her all that which is good and necessary for our refinement, our delight, and inspiration. The intensity of our art must be in accordance with the intensity of our interest in the creation around us generally—in construction, and in our broad grasp of the whole art of building, past and present. Design is the expression of this delight and interest, conveyed in a harmonious manner according to the limitations of the materials dealt with. But what of the delicate matter we are all of us so apt to overlook and trip-up over—I mean the gift of selection and discretion dividing man from man or uniting them, which passes under the name of "individuality," if there be such a thing! It is not my province to-night to open up

THE QUESTION OF DESIGN,

but I believe much more might be done than is being done in the nice management of straight lines, and slight curvature, rather than the orthodox late 19th century "School of Art Curve" we see so much of—the very curse of the age, born of drawing-paper conceptions and lack of thought in material. All the crafts must draw blood from the ranks of architects to bring about a thoroughly healthy condition, and that there will be a time when architects' work will be less minutely detailed in offices than now, and the working-out of things done by sympathetic groups or amalgamations of workers where architects and craftsmen co-operate and work in a concord and unity, when every man who transfers his attention to craft work will be regarded as a distinct gain to the art of building, and to (what we now call) the "architectural profession." There is plenty of scope for such men; plenty of demand for such good work as the value of their previous office training can add to technical manipulation. Each individual is as much responsible to himself as to the public for his actions in the encouragement or the discouragement of personal craftsmanship as are the general mass of architects, and on individual effort depends the future of craftsmanship; and, furthermore, the art of building will more nearly approach its long-past state of vitality, will again be endued with a new hope, a new life, a new vigour, and a real and living purpose when men of refinement, intellect, and discretion draft themselves from the practice of paper architecture into craftsmanship—when architects become craftsmen and craftsmen architects.

ARCHITECTS AND CRAFTSMEN.

At the present day the relationship between

the architect and the craftsman is rather curious. In the anxiety to please one's clients, and to increase one's business, we are apt to let some things slide, and to do things absolutely against the laws we frame for ourselves and are so determined to renounce. Here it is that little matters crop up which are as disappointing to the craftsman as to the architect. It is sometimes a matter of extreme delicacy, but perhaps not beyond remedy and further resolve. Personally, I have little cause for complaint, and yet I know the evil exists. The relationship between architect and craftsman, one might say, is a matter of influence and sympathy? Not altogether so. It is gradually becoming so, and will ultimately be so; but there are serious drawbacks, where able men are denied opportunities of doing good individual work. I know many such instances. For example, we hear of men deserting "office architecture" for some craft or another, for the good of architects generally and of the building world. Time alone will possibly alter this. It is due in a great measure to the unequal fermentation in the evolution of art matters. It is even necessary in many cases, one would say. There cannot be a cause without effect; but sometimes it has a detrimental effect—an effect which stifles the best intentions of a good workman, extinguishing rather than invigorating. If he is healthy, and strong enough to refuse and withstand this negative influence, all well and good; but there are men of delicately strung fibre who are unable to withstand it, and sink into oblivion through this influence. Their hearts are crushed out of them. Another controlling influence is

THE MATTER OF PRICE.

I say little against it, as it has its good influence in restraint, as also its evil influence in other ways. But it is worthy of consideration, if not of discussion. I know, as an architect, the various causes from which it arises, and how in many cases it might be avoided. Sometimes it arises from the haphazard assessment of prime cost on the part of the architect; sometimes from the unsympathetic, cut-and-dried system of the quantity surveyor, often from necessary economy; sometimes from a desire to get the utmost possible for the client; at other times from an incomplete knowledge of actual working cost of things; sometimes by the unreasonable idea that good work can be done at the price of inferior. A very great deal of disappointment to architect, client, and craftsman might, I think, be averted by a little consultation and consideration of the matter before bills of quantities are issued. It would also be a great help to both parties, and save endless waste of time and energy, if a maximum sum could be named where it is difficult to provide more than very modest means for possible decorative purposes. With a craft such as I have elected to follow there are numerous ways of doing simple work in a quite nice manner with ordinary materials and methods, properly handled, which it would be impossible to indicate on a drawing. You understand me? Matters, merely of texture and handling, only to be realised by a man knowing his material, as an artist knows his paper and colours, and what can be done with them. The architect with much work has not the time, if he would, to acquire all the technical qualities of materials as they present themselves by accident and experience to a craftsman on the look-out, nor has he the same opportunities of rightly knowing the actual working cost of different methods as he who is conversant with them by finger-touch and constant association.

UNDER ESTIMATING PRIME COST.

In conclusion, allow me a few words concerning the actual cost of craftwork and architects' estimates, and prime-cost allowances. I am well aware of the monetary difficulties we, as a rule, have to face in planning out of new building schemes, and I know too well how they often have to be reduced. We sometimes have to cut the coat according to the cloth; but there is one habit some men have, whilst desiring to encourage sympathetic work, which habit seems generally inconsistent—I refer to the matter of under-estimating prime-cost amounts provided for this, that, and the other, including decorative work, of imagining that respectable craft work can be had at the price of "shoddy"—that good work and bad pay are synonymous. The under-estimating of prime-cost amounts must mean one of three things—that either one's client must be asked to spend more than he at first bargained for; or that

the scheme must be reduced; or that the craftsman has to do the work at a personal sacrifice, or at so low a cost as to barely get home over the transaction. Again, one hears the argument that a certain kind of work will not bear more than a certain cost. This is, I believe, an argument based on inexperience, or ignorance of process, and of circumstances controlling it. It is curious that this argument is never applied to the cost of the fabric, or shell of a building, but only to various kinds of craftwork where modest skill is concerned. It should at least bear its own working cost, and a living profit in addition, otherwise, where is the inducement for the good workman or craftsman to excel in his calling? And yet this method of judgment is frequently brought to bear by men who swear by all that is good and true. To compare the relative cost of the two kinds of work is most difficult. Architects who are accustomed to—and only accustomed to—the everyday cut-and-dried stuff, can only estimate for the work they want done by the average cost of the material they have been in the habit of using, and many find a difficulty in estimating for anything different. They will certainly find themselves very much "at sea" if they persist in prime-costing superior work at the same rate they have been in the habit of allowing for inferior work so much in vogue. This system is not likely to encourage "sympathetic" work, and must sooner or later stifle any attempt to elevate craft-workers, no matter what the medium, from unthinking mechanical drudges into intelligent, capable craftsmen, and in the end, men who know better, and desire better, will be compelled to revert to old trade methods and systems which are so offensive to their aesthetic susceptibilities. Boiled down, this all means that the architect must educate, educate, educate his clients, and furthermore must insist upon his own views being carried, even when opposed to those of his client, or otherwise it means grind, grind, grind on every hand as a matter of principle.

A vote of thanks was heartily accorded the lecturer on the motion of Mr. E. GUY DAWBER, seconded by Mr. JOHN D. CRACE, and was briefly acknowledged.

THE SOCIETY OF ARCHITECTS.

THE members of the Society of Architects held their first meeting in their new hall, Staple Inn-buildings South, on Thursday evening in last week, when a discussion took place on the Ancient Lights Bill, which is to be introduced next session, as the outcome of the labours of a joint committee of the Royal Institute of British Architects and the Surveyors' Institution. We dealt in some detail with the measure (which is to be introduced by Mr. Fletcher Moulton, Mr. Haldane, Mr. Robson, Mr. H. D. Greene, and Mr. Herbert Robertson, and which was read a first time last session on June 22nd last) in our issue of July 10 last, p. 35 current volume. The President, Mr. Walter W. Thomas, of Liverpool, occupied the chair. Four nominations were read, and the following six gentlemen were elected as members:—George Hamilton Briggs, 43, Crowther-road, S. Norwood, S.E.; Henry Leon Cabuche, 31, Hamlet Court-road, Westcliff-on-Sea; Morris Jacob Harris, Mafeking, South Africa; William David Jenkins, 12, Frederick-road, Sparkhill, Birmingham; John Stuart McDonald, 8, Esplanade-row, Calcutta; and William Mapp Thompson, Baron Grove, Mitcham.

PRESENTATION OF THE GOLD MEDAL.

THE PRESIDENT said it was his privilege to present for the first time the gold medal which had been offered by the Council to the student who passed with distinction in every division of the society's examinations, and foremost of the candidates who had submitted to the ordeal during the year. This had been gained by Mr. William David Jenkins, of Birmingham, one of the gentlemen whom they had that evening unanimously elected to membership. Mr. Jenkins had served his articles at Llandilo with his father, who, they were gratified to see, was also present that evening, and had since been with a firm of architects at Birmingham. He trusted that Mr. Jenkins would make the honour and welfare of the profession his foremost thought, and that at some future period he would occupy that presidential chair, and be the medium of conferring similar medals on candidates of a later generation. The President then handed the medal, amid hearty applause, to Mr. Jenkins, who suitably acknowledged the gift.

THE PROPOSED ANCIENT LIGHTS BILL.

A discussion upon the value and merits of this measure was opened by Mr. ELLIS MARSLAND, hon. secretary, who remarked that he could not support the proposals put forward; indeed, he objected to them *in toto*. The Bill did not, in his opinion, go nearly far enough, nor was it framed in the right spirit, for it dealt with the question of easements to light as if they ought to continue to exist. He might instance the subject of sky-signs in the Metropolis as an analogous case. A few years since, London was visited by an epidemic of sky-signs, which were speedily recognised to be a nuisance, a disfigurement to our thoroughfares, and to involve some risk to passers by. They were not treated by the Legislature as an easement to be tenderly dealt with, after compensation to the owners, but an edict went forth for their entire abolition after a certain period of grace. The like severe but perfectly fair treatment might very justly be applied to all existing ancient lights. A man who chose to build had no justifiable claim to demand that his neighbours should grant him light over their lands simply because for twenty years they had acquiesced in his so taking his light across their premises or lands. If a man could not obtain his light from within his own curtilage, it was his own fault. Some might think his argument revolutionary, but a similar law to our easements of light did not exist in Scotland, where it was not possible to acquire by efflux of time rights to light over an adjoining building owner's property. If they were to legislate on this question, let the reform be a genuine and salutary one. The Bill should declare that on and after a certain specified date, no rights to light over adjoining property should begin to accrue. As for existing and recognised easements, the same Act should stipulate that after a given number of years—say, twenty—those rights to light should be extinguished. A further radical defect was the proposal to appoint nine gentlemen, appointed to rove from town to town as a peripatetic tribunal. Such a number was poorly inadequate to requirements. It would lead to great delays in the settlement of light claims.

Mr. G. GARD PYE, vice-president, said he could not agree with Mr. Marsland's drastic and, indeed, revolutionary proposals, which he thought would be exceedingly hard on the possessors of ancient light easements. There were, however, several grave objections to the Bill as draughted. There was elaborate machinery provided for the constitution of a tribunal of appeal of nine members—three barristers, three architects, and three surveyors—and after a case had been tried and adjudicated upon by a quorum at heavy cost, the whole matter could be reopened before a Judge of the High Court, where the amount in dispute exceeded £500, and the whole award might be upset on appeal. If a tribunal consisting in equal parts of skilled barristers, architects, and surveyors could not decide a case, all the judges in the land could not arrive at an equitable decision. The judgment of the tribunal ought only to be challenged upon allegations of errors in law or of dishonesty. Another defect in the measure as draughted was that the only bodies recognised by the Bill were the Royal Institute of British Architects and the Surveyors' Institution. Steps should be taken to insure that the Society of Architects, as a growing and important representative body, was also recognised in the measure.

Mr. WALTER C. WILLIAMS observed that the Bill provided certain great advantages as to procedure under the existing law, although there was a great and radical defect in its draughting. It provided in Part III., section 3 (1), that only such light as was "reasonably necessary for comfortable use and enjoyment" could be claimed by a dominant owner; but in every case the settlement of what was a "reasonably necessary" light would prove the most fruitful source of litigation in any dispute. The provision in Part IV. that an obstruction to light could be created by serving a notice on the adjoining owner instead of actually constructing a hideous hoarding, was a very good suggestion; but lawyers and members of the tribunal would, under that section, need to possess a vivid imagination. But a grave defect in the measure was the omission of any penalties for failure on the part of a vendor to disclose that an obstruction to light notice had been served upon him, or as against a lessee who neglected to forward such a notice to his next superior landlord. There were other omissions in this section, and he held that a measure draughted so laxly could

not be, if passed, of any advantage to the public. The chief feature of value in the Bill was the effort made to lessen the amount of expert evidence that could be tendered in an action. All professional men who had had experience in arbitration knew the real value of such testimony, and any proposal which would enable litigants to get rid of expert evidence would tend to cheapen the course of justice. The worst feature of the Bill was the final clause, section 7 in Part VIII., allowing of an appeal to the High Court where the amount awarded exceeded £500 in money, damages, or cost of works. Any arbitrator's award should be final, except in two events—where the arbitrator was mistaken in his law or acted dishonestly. Under the Bill, more paid work would fall to the architect and surveyor, and less would be received by the lawyer; but the client would suffer equally in pocket. The gravest defect in the measure was that it recognised the right to light over another man's land—a principle only sanctioned in England—and that only within the last sixty years or so. The admission of such a right to light was a noxious weed, the growth of modern judge's dicta, and one which ought to be uprooted, whereas the Bill only tried to lop off a few branches, and to cut down some of the rank undergrowth. What was needed was a short Act providing that after a certain specified date no future rights to light should accrue. Any attempt to deal summarily with existing vested interests would wreck the Bill, for all existing rights would assuredly be respected by Parliament.

Mr. R. B. TUCKER supported the views of the last speaker, but regarded Mr. Marsland's suggestions as too revolutionary.

Mr. R. FRANK VALLANCE said that all architects, from a professional standpoint, would regret to see the law of ancient lights abolished, for they provided the profession with much lucrative business. He held that some reform was necessary, but no existing rights ought to be abolished, unless compensation was given to the owners. The best feature of the Bill was Part IV., the proposal to substitute notices of obstruction for disfiguring hoardings.

Mr. C. H. MEAD thought the proposal to refer such cases to two surveyors and a barrister was an excellent feature of the measure; more substantial justice would be done by such a tribunal than by a judge trained only as a lawyer, and probably at a much less cost. Even under the new proposals, a light and air case would, he expected, prove very expensive.

The PRESIDENT referred to what had been done in Liverpool, as demonstrating that in the great majority of cases disputes between a dominant and a servient owner could be settled by friendly conference. A notable fault in the Bill was that the Society of Architects was entirely ignored by its promoters, and he thought steps should be taken to amend this. Apart from this, the Bill, in his opinion, was a most crude and ill-defined one, and needed reconstruction.

Mr. R. W. ROQUES moved that the Society oppose the Bill in Parliament, and employ counsel to protect those interested, and to secure needed amendments of the measure; and, further, that notice of opposition be given to the Royal Institute of British Architects and to the Surveyors' Institution.

The motion was seconded by Mr. GARD PYE, and, having been supported by the PRESIDENT, was carried unanimously.

"THE MANAGEMENT OF DECORATIVE WORK IN PROGRESS."

UPON the management of work in progress must always depend its satisfactory result, not only as work, but as to its profit and the continued good relations between all concerned. As far as I have observed, however, the careful organisation necessary for this is too often wanting, and a great deal of waste occurs through lack of any general scheme of management. As painting is always conducted more or less away from the master's premises, it only too easily happens that, through want of systematic communication, little delays occur, each one possibly very small, but together becoming important, and important in most of all in producing that slight sense of hesitancy—of waiting for something—

which all too rapidly affects every man on the job, and does more to increase the time-cost of work than any other ordinary cause. When it is obvious to the men that the materials are waiting for them, that the instructions are clear in advance or come with certainty when required, and that the foreman of the job is able to place his men with confidence where required, every man works better and faster. There is no dawdling, because there is no excuse to dawdle, and quite a different spirit animates the men when the work goes forward smoothly. To say that this may easily make a difference of 15 or 20 per cent. in the labour cost of work is no exaggeration, and such a difference not only means success or failure in competition and profitable execution, but it enables the master to put in better work, and to improve his reputation by doing so. Nothing pleases the client or his architect more than to find a readiness to go a little beyond the wording of the contract, and this can often be done. Well, then, let us see what sort of organisation will conduce to good management, and in doing this, I must argue from the position of a firm prepared to undertake fairly large works of an ordinary kind, because, although good management is important in all work, great or small, it is obviously of more importance in large work, and the organisation needs to be more complete. Moreover, while there is plenty of room for variation in the detail with individual firms, according to their constitution and the nature of the works they undertake, a general principle will underlie successful methods of management, and the adjustment of details is not a difficult matter when the principles are kept in mind. The organisation will, in a sense, be twofold—viz., that at headquarters—i.e., the master's business premises, and that at the job itself, which may be "in town"—that is to say, within easy daily control from headquarters; or in the country at such distance as to admit only of more occasional control and direction. Let us take "headquarters" first. We there require (besides the bookkeeping staff, which I do not propose to deal with):—1. The colour-shop and stock. 2. The scaffold yard. 3. An active head foreman, with one or two intelligent painters' labourers under him. 1. The colour-shop is practically the working centre from which all the necessary materials, tools, and appliances are issued. Attached to it should be a small lock-up office for the foreman, and one or more lock-up storerooms for the colours, tools, implements, and materials which are necessary for issue at short notice, or before office hours. Rough entry-books must be kept, in which every article issued can be booked to the job, and all "returns" noted. A colour-grinding slab or two, and hand mullers, though less indispensable than formerly, are at times very useful, and shelves for pails, pans, and cans will help good order. Either in the colour shop, or near at hand, should be the oil tanks, capacious enough for at least two years' consumption, and space for casks and firkins of white lead, which should always be kept in stock, and bought well in advance. If there are three oil-tanks, the contents can be used one at a time in succession, each tank being refilled as soon as empty. The scaffold yard should, if possible, be close at hand, so that the foreman may at once see what is available, and keep it all well under inspection and in good repair. I need not go into minor details. The point is that premises and plant should be fitted for the prompt supply of the ordinary requisites, in condition ready for use. The qualifications desirable in the headquarters' foreman differ a good deal from those of the foreman of the job, and there are reasons why it should not be too much insisted on that he is the head foreman. He is the centre means of communication, but should not be encouraged to override the local foremen in their management of their own jobs. He ascertains what men will be required, and engages them and discharges them. He collects the time-sheets, and checks them; issues the materials; ascertains what scaffolding will be required, and takes care that it is ready when wanted; corresponds with the country foremen, and learns from them when they will be ready for men, or when the number may be lessened; he arranges the transfers from one job to another, and should know exactly which men are best fitted for the work to be done. In fact, he should be the master's eyes and ears in all matters of detail, and be always ready to report verbally on the state of each work. I think it very important that this "central" foreman should not be too old a man. He ought

to be young enough to be very active, for he will require to be constantly on the move in busy times. A bicycle is a very useful accessory for him, for by its aid he can run round to two or three works in the early morning, and be ready to report on them by the time the business office is open; and in any matter of urgency it will often enable him to see for himself instead of sending a messenger. He ought to be a good practical painter; and he should be able to make a correct plan, or to measure up simple work: to use the more expert he makes himself in this direction the more valuable will he be when he ceases to be a foreman. His "labourer" assistants must be intelligent men, who can read and write fairly well, and are capable of entering outgoings. If one of them is a scaffolder, so much the better. We now come to the organisation at the job, and here we must for some reasons divide the subject under two heads—"town jobs" and "country jobs," to use the familiar word. Inasmuch as work "in town" is within easy reach from headquarters, it can, to some extent, be directed thence almost daily. It is, therefore, less necessary that the foreman of the job should be either so experienced or self-reliant as we shall see to be requisites for country work. He can be helped in moments of difficulty by a visit from headquarters. It is more important that he should be punctual, careful, and a good manager of men, than that he should have any artistic or otherspecial technical qualifications, for these will be readily supplied otherwise. But he should be both strict and just, and the man who disregards his instructions twice should not have a third opportunity. In more ordinary and smaller works, where from four to a dozen painters suffice, the foreman should be a skilled hand, who can be depended on to work himself and keep the others working. It is very convenient when such a man can draw a little, put in trials of colouring, and do a little writing or gilding. This applies still more where the small work is in the country, and to send down specialists means undue proportion of cost. With large works at a distance, such as public buildings or very large mansions, the most important qualifications for a foreman are punctuality, sobriety, tact with men, the habit of looking ahead, and good, self-respectful manners. A man prone to quarrel, or to be easily moved to angry replies, should never be put in charge of country work: he is sure to make enemies among the men or the servants, even if he does not fall out with the owner. But a certain self-reliance and forethought are very indispensable qualities in the foreman of a country job—and the man who only knows what is wanted when he actually feels the want, is not the man to take charge of country work. In organising the work itself at a country job there are certain preliminary inquiries to be made, the replies to which may much affect the arrangements. These are, first, What facilities are there for obtaining scaffolding?—for although it is probably better to send down a few "steps," it is, at long distances, essential to hire (sometimes to buy and sell again) the pole scaffolding, and probably better to get the tressels roughly made to the proper heights. The question of lodging facilities should also be gone into in advance; for occasionally this presents a real difficulty, and is very apt, if neglected, to raise disputes. Arrangements should always be made for the foreman to lodge near at hand, if not on the premises. These are matters the neglect of which may cause serious delays, and should never be left to chance. Again, it is desirable to have an understanding as early as possible as to where the workmen may take their meals; and, if there are to be many men, who is to do their cooking. It is better to let the foreman engage a woman for this: otherwise you will find that one labourer's time is practically occupied over the men's meals. Of course, in a town some of these questions do not arise; but country works are often far from a town. The question of obtaining labourers on the spot for unskilled labour should not be forgotten. Another matter which often arises is the question of obtaining the suitable change for paying wages. I have constantly found it necessary to send country wages in the form of gold coin in parcels by registered post; but even then much time is often lost in obtaining the necessary silver and copper change for a number of men. Where the work is in or near a town where there is a bank, it is sometimes as well to open a temporary account with the local bank, giving them notice that a certain approximate amount of

* A paper read before the London members of the Incorporated Institute of British Decorators, by JOHN D. CRACE, Hon. A.R.I.B.A., President, on Monday, December 14, 1903.

silver and copper will be required with the change for your cheque each week. You then send your cheque for the required amount of wages to the foreman, who reckons up beforehand the proportions in which he requires his change. In very large works, take care to have one man who is skilful in matching and mixing colours. This would occupy too much of the foreman's time, for he needs to be moving about and seeing that as each man finishes one job he has another ready for him. If he finds a man habitually shirking, it is cheaper to send him back to town than to keep him. A loafer always tries to get others to loaf too. I have, so far, said nothing about the artistic part of the work; but, assuming that some of it is to be executed by artists on the spot, it is obviously very necessary that as early as possible the preparations for this should be made. Dimensions of all parts to be ornamentally treated should be taken directly such parts can be got at, and where ceilings and cornices are out of reach with steps and ladders, it is often worth while to erect the scaffold, or part of it, before it is otherwise wanted, to enable careful measurements and paper templates to be taken, in order that full-size sketches and drawings may be prepared in good time. These should first be drawn in charcoal, and if possible tried up to judge of form and scale before being definitely drawn in—particularly when the height or proportion of the place is unusual. Even with much experience one may easily be deceived about scale at unusual heights, and it is easy to find cause for regret when this precaution is omitted. When there is much repetition, trials in colour should also be prepared. Where the bringing forward of the grounds is likely to leave scant time for the artist, that portion of his work which requires most time and care may be executed, up to a certain point, on canvas, and affixed, and completed by him on the spot when the general work admits of it. In such a case, however, it is most important that he should be acquainted with the exact circumstances of the lighting, the position of the windows, &c., before he begins; and it will hardly be safe for him to begin his colouring until the general grounds and the relieving tones of colour of the surrounding surfaces have been decided by actual trial on the spot. Even then the decorator must be prepared to make some alterations up to the last moment. When the actual tints and colourings have to be decided, the person who is to direct the colouring (and he ought to be the master decorator himself) should give notice of his visit for the purpose, that the foreman may have all ready—colours, boards, and palette, suitable fitches and sables, and small pans for the samples of colours when decided. Particularly, every local foreman should be provided with a palette-knife (artist's size) with which the master may mix his trials in small quantity. Nothing is more vexing than to find, when about to try colours, that the only available palette-knife is an implement with a blade 1 ft. long, and perhaps 1½ in. wide. It makes a mess of the whole palette with the first tint mixed, and much time is lost. Then the pigments likely to be used should be ready, arranged in order on a trestle board covered with a clean paper if the tints are to be delicate. And here I may say, parenthetically, that the pigments ordinarily required are few, and that all the fancy blues and rose-colours, of which ill-trained foremen are so fond, are absolutely unnecessary in nine cases out of ten. They are, moreover, apt to do harm, being frequently very fugitive. When a complete trial, say of the cornice colouring, has been made, samples of each of the approved tints must be put aside, either in pans, or, if small quantities, on stencil paper, for guidance in the work. There are one or two of the local foreman's duties in which exactitude is most essential. (1) Taking plans and dimensions. These should always give total dimensions as well as details from point to point. Then, if these do not agree, the error is discovered in time. It is a very common occurrence to find them differ by 2 ft. (one repeat of the rule), and I need not point out what a costly blunder this may be. Another source of trouble is in ceiling plans, on which it should always be made clear whether they are taken "looking up" or following the floor plan. For, if the form be at all unsymmetrical, the deviations are reversed. (2) Making out the weekly time-sheet. Each week's sheet should not only show how many hours each man has worked, but on what portions of the work the men have been engaged. And if any man's time is less than it should be, or more than there was reason to expect,

an explanation should appear on the sheet. If one man's time seems to be short during two weeks or more, special explanations should be written for. The master is paying lodgings and allowances to the same extent per week whether a man works 60 hours or only 40. Among the many possibilities of delay there is the joiner's work; taking off fastenings and furniture, easing windows, small repairs. Let these matters have attention in good time. A more annoying cause of delay often occurs through the work of "other trades," and this is frequently beyond the decorator's control. The operations of the plumber, bellhanger, gasfitter, electric lighter, and, worst of all, the hot-water man, are, not without cause, a terror to the decorator. Each thinks he ought to take all the time till the last day fixed for the general completion; while there is much that the decorator can hardly begin till most of these others are gone. In this matter I can only recommend you to use the Institute of Decorators' forms of contract as a precaution. When work involves much or high scaffolding, bear in mind the importance of getting that portion which is only accessible from the scaffold properly measured and taken to account before the scaffold is removed. This is a matter which the foreman should give ample notice of, and he should have been able to get a good deal of measuring done during progress, where it is out of reach otherwise. This will save the surveyor's time. He should also have clear notes ready as to number of coats, &c., in different rooms, and the amount of extra daywork. In fact all the way through the work, the foreman must bear in mind the final bringing to book, must make a point of being able to explain. He should also insist on cleanliness—his labourers must be frequently sweeping up the dust and any accumulations. I have omitted to speak of one or two details in this connection, as, for instance, the sweeping of chimneys before any painting is done, the covering up of furniture, and floors, and panellings. A good hardwood or parquet floor should be covered first with brown paper, then with sawdust, then with thin boards. But never lay brown paper close down on a white marble floor: it will stain it indelibly. Clean wrappers covered with boards are safer for this. Again, it should be absolutely forbidden the men to throw the water which has been used for washing off distemper down the sinks or closets. It must be taken to the gullies, and even these should be frequently flushed with clear water when so used. With a good foreman London workmen will be on good terms with the servants and neighbours. In country places workmen of good character and conduct can be a very pleasant addition to village society, and are readily invited to join in whatever amusements go on after working hours; and I have known many a client say that household and village have all regretted the men's departure. In winding up work, leave all clean, room by room, as you finish. It is always worth while to hire a charwoman from the village to scrub the floors during the last fortnight, and it pleases the house servants to find that they are not expected to clean up after the men. The goodwill of the servants is always worth having, but never worth buying. Where particular servants have been obliging and helpful to the men some recognition is very proper; and where a servant has suffered distinct inconvenience by the work, I think a moderate tip may well be bestowed. In doing this, the master should say that it is in consequence of the foreman having spoken of the inconvenience or the obliging help in question. Let no master decorator lower his own position by "cultivating" the servants, nor notice in any way the hints of "influence" which some upper servants are ready with. Make your own influence with your client, and you will best do this by close attention to all that makes the work go smoothly and in accordance with his reasonable requirements.

WATER PURIFICATION.

At the ordinary meeting on Tuesday, Dec. 15, of the Institution of Civil Engineers, two papers were read, namely:—"Deposits in Pipes and Other Channels Conveying Potable Water," by Professor J. Campbell Brown, D.Sc., and "The Purification of Water Highly Charged with Vegetable Matter, with Special Reference to the Effect of Aëration," by Osbert Chadwick, C.M.G., M.Inst.C.E., and Bertram Blount, Assoc.Inst.C.E. The first paper dealt with three classes of

deposits:—(1) Incrustations on iron pipes; their source, causes, and remedy. (2) Growths, more or less slimy, on inner surfaces of pipes and culverts and tunnels; their varieties, nature, composition, and causes; also the composition of waters which produce different kinds of growths. (3) Loose deposits. Analyses were given of incrustations on iron pipes, and analyses of different kinds of waters were quoted, showing that these incrustations were due to oxidation of the iron of the pipes, whether widespread or in nodules, and that they were not limited to acid waters, but were common to acid, alkaline, and neutral waters. The remedy was briefly discussed, in the light of recent experiments as well as earlier observations. Growths or deposits on the inner surface of pipes were of two kinds:—(a) Deposits of carbonates of alkaline earths from calcareous waters; (b) black slimy deposits, from the top, bottom, and sides of pipes and other channels conveying certain waters, chiefly from Welsh sources. Investigations were recorded, and detailed evidence was adduced, showing that these slimy deposits were produced by gelatinous and filamentous iron-organisms which grew and extracted iron from the water, and died at one end while they grew at the other. Solid rock particles were entangled in this slime, and binoxide of manganese was deposited by chemical action, and this also was entangled in the mass of the gelatinous iron-organisms. Analyses were given of waters which did, and a variety of waters which did not, support the growth of this slime, and deductions were drawn as to the constituents of the waters on which these growths depended. Experiments were described, undertaken with the view of ascertaining the conditions favourable to the growth and the conditions which would prevent the multiplication of these organisms and the growth of the slime. Microphotographs were given of these growths at different stages, and the results of the experiments were described and discussed, in order to arrive at a correct theory, and so at a practical result.

TROPICAL WATER.

The second paper treated of the nature of tropical waters collected in regions free from ordinary sources of contamination, but containing large quantities of dissolved vegetable matter. These waters, wherever their place of origin, presented a great similarity of composition, samples from Mauritius, the West Coast of Africa, Uganda, and the West Indies having the same characteristics. In all cases contamination was caused by the water remaining stagnant or flowing slowly through regions rich in vegetation, which by its decay produced a large quantity of vegetable debris absorbable by the water. Pure Tropical waters might be obtained even from a district densely covered with vegetation, provided that the flow was sufficiently rapid. The purification of waters of this class was very difficult. The authors had found by experiment that treatment with iron was generally efficacious; but the treatment must be more thorough than was necessary with ordinary water-supplies. The peculiar character of these waters charged with vegetable matters rendered the removal of the iron difficult; casual aëration by fountains or cascades was insufficient. Systematic aëration, so as to insure an abundant supply of oxygen, was requisite. Various methods had been tried, and finally an apparatus had been devised in which the water was caused to flow through perforated plates, emerging in streams of small diameter and exposing so large a surface per unit volume of liquid that rapid absorption of oxygen from the air was made certain. It was found that, if the water was delivered at or above a certain critical head, the streams of liquid remained distinct, and if they were caused to coalesce by some temporary disturbing influence, such as a gust of wind, they resumed their position and individuality as soon as the disturbing influence had subsided. The use of this critical head was essential for the proper working of the apparatus, and for the satisfactory aëration of the water. Plant designed on this principle had been erected to purify the water supply at Mauritius and in Uganda; the method had sufficed to change water so loaded with vegetable matter as to be almost unpotable, into a drinking-water of excellent quality. An account was given of the waterworks at Mare aux Vacoas in Mauritius, and of the various improvements in the mode of purification which had been effected from time to time. The principle of aëration had also been usefully applied at Singapore by means of intermittent filtration; but the

authors held that the systematic process described above was preferable on account of its certainty and compactness. They considered that by this means it was practicable to purify diffident tropical waters so as to obtain a satisfactory supply without excessive cost or difficulty of working.

IRISH BUILDING STONES.—IV.

CORK—(concluded).

THE Little Island quarry mentioned in the last article as that which furnished red marble for Liverpool Exchange and Oxford Natural History Museum is now worked exclusively for light grey limestone, the red vein having been exhausted. The main body of St. Finn Barrs Cathedral was built with Ballintemple stone, but Little Island limestone was used in the towers and spires. The new Post-office, the Provincial Bank, Trinity Church (Cork), and many Government buildings on Haulbowline and Spike Islands are built with Little Island stone, which is easily worked and looks bright, contrasting in this respect with the blue shades of Carboniferous Limestone, which, being of a slaty-grey, are rather dismal looking, especially in a moist climate and under leaden skies. Nearly all these limestones retain their colour after long exposures. Toolmarks are as fresh on them as when they were worked centuries ago, and it may safely be said of the Irish Limestones that granite itself is a perishable stone compared with them, and this is true of cut stone dressings obtained from rocks the chemical analysis of which differ in no way from common soft white chalk. Carbonate of lime forms about 98½ per cent. of Carboniferous Limestone, and this is about the composition of Margate chalk. Why, then, is one stone so friable, and the other so hard as to weather this climate for centuries? It will be noticed that all hard limestones can be polished as "marble," and that they are highly crystalline in structure; this structural change appears to confer weathering properties on material which is otherwise valueless for the purpose. Now, as all crystalline stratified rocks were at one time chemical or mechanical sediments, it is obvious that they must have been altered by some process of metamorphism. In this case it was one of molecular change only, though in the white marbles, as, for instance, statuary, chemical change also took place, and all non-calcareous matter was eliminated from the rock. Whether beyond heat and moisture there were other necessary conditions for metamorphism is not at present known for certain in such a simple case as the change above referred to (earthy to crystalline limestone); but it is invariably found that the permeability to water and the alterability of sedimentary strata are greatly reduced by such alteration. It will be recollected that in describing the Antrim rocks chalk was found converted into crystalline limestone by the intrusion of molten basalt; where ordinary or normal Irish Carboniferous Limestone is found converted into Magnesian Limestone the change is due to chemical action, combined with other metamorphic agencies; but this process must not be extended to the great dolomitic deposits of the Permian strata in England, for it is proved that they were thrown down from concentrated solution in an inland salt lake, the waters of which were removed gradually by evaporation. The Silurian and Devonian rocks of Cork furnish good sandstones, which are known to the workmen as "brown" or "Red" stone, the Lower Carboniferous sandstones being "yellow" stone. Formerly sandstone was much used in building, especially for dressed work. The Round Tower at Cloyne is built with it, but in newer buildings in the same locality the dressed work is always of limestone brought from some distant quarry. The Round Tower at Cloyne is in a good state of preservation, and as it is a prehistoric building, the value of the light-brown as a building stone, of which it is built, may be guessed by its present condition. It is quite true Petrie tried to prove that the Round Towers were of comparatively recent date, probably about the 9th or 10th century, and consequently of Christian origin; but as his views were based on certain details in or about the doors and windows of these structures, which might have been, and probably were, later insertions, his arguments go for nothing. Take the Kildare tower, for instance. There is a fairly good "Norman" doorway, giving admission to it at a height of about 20ft. from the ground, and this

being clearly a late insertion, the age of the doorway can give no clue whatever to the age of the tower. Crosses have also been inserted in the walling over the doors and in the roofs of some of the towers; but no one has ever yet explained of what use these towers could have been in the performance of any act of Christian worship. In the case of the Kildare tower referred to above, it stands over 50ft. away from the church at the north-west end, and it has no connection whatever with it. When a circular tower is found at the west end of any church in East Anglia, archaeologists assert the shape is due to a want of stone to work square quoins, but the Irish towers are not round from this cause, for massive stone of suitable quality is common enough all over the country. As this is not the place to discuss the various opinions expressed as to the origin and uses of these strange buildings, the writer will close this reference to them by saying that it is extremely probable they are relics of Phallic worship, and are consequently amongst the oldest buildings in these islands, Stonehenge not excepted. Good building sandstones are found at Sherkin Island; Drumeona, six miles from Skibbereen; Glendore; in the mountains near Mallow; on the Duke of Devonshire's property near Bandon; and in several places near Cork on the north side of the Lee; but there are no quarries of any general interest in the sandstone rocks of this county at present. Many of these sandstones have cracks or fissures in them, which make the stone valueless for some purposes, and this even though the blocks look dense and compact to the eye. All the sedimentary rocks in this county yield slates. In 1835 the following quarries were in work, producing slate of "good" and excellent quality:—Probst and Glentane, Ringabella, Ennisearra, Kilbrittan, Bracknagh, Enniskeen, Mohanagh, Rooska, Audley Cove, Sherkin Island, Clonakilly Bay, Forkhill, Donaghmore (the two latter being near Clonakilly), Robert's Cove, Trabolgan, Carrigduff, and Derry Gool. Five hundred hands were employed in the Audley Cove slate quarries, the produce of which had a ready sale in London. The Sherkin Island quarry was worked by 100 men, and many cargoes of slate were also sent to London (in 1835). Robert Hunt, in scheduling the Cork quarries in 1860, does not mention one as being worked for slate; the output then was marble, limestone, and sandstone. Last year there were four slate quarries in work—viz., Benduff, Braalish, Drimoleague, and Madranna; but the managers of these have not sufficient energy, or business capacity, to answer an inquiry as to the quality, size, or price of their slates. The slates in these quarries are dark grey, some nearly black. Pyrites, nodules, and a curly structure are sometimes found, and they, of course, take much from the value of the slate as a roofing material. The Benduff vein, which is 70 yards wide, turns out very dark grey slates. Slate rocks have always been used in this country for building; they are worked into sills, steps, and rough quoins when dressed, and rubble walling when simply broken across with a hammer. The Round Tower of Kinneigh is built with slate rock, and so is Timoleague Abbey, an early Irish building, which illustrates the good quality of the slate, and the simple and proper mode of using it; "the design and constructive arrangements being suited to the materials employed." Near Bandon slate rock makes a good building stone, for it can be joint-bedded, and worked freely across the end grain. Since writing on the composition of Irish Carboniferous Limestone an analysis has come to hand which enables one to make an exact comparison of the chemical constituents of that rock with those of chalk, the latter being a specimen of the "upper white" from Shoreham in Sussex.

	Cork Limestone.	Sussex Chalk.
Carbonate of lime	98.35	98.40
Carbonate of magnesia	0.60	0.68
Alumina	—	0.42
Iron oxide	0.60	—
Silica	0.23	1.10
Water	0.25	—

It will be seen that the amount of carbonate of lime in both rocks is practically the same, and that they differ only to the extent of 1.6 per cent. in accessory substances. Yet the limestone will carry 400 tons to the foot, while one ton could not with safety be placed on white chalk without risk of failure. The analysis of limestone given here was furnished by Mr. Cantillon, being that of an average sample from his Little Island Quarry. He has also quoted the following

prices for labour only on this stone. Quoins with chisel draft on arris, and punched face 5s. per foot superficial, tooled work 6s. Chisel drafted and punched is quoted at 6s. per cubic foot, and tooled work at 7s.; but what the latter prices refer to is not easy to understand, for work is not usually done by the cubic foot, though any practical mason can tell, on looking at a drawing, what the value of a cubic foot of masonry is, "labour and material" both included, without pricing out all the labours as suggested by the modern London surveyor. The hard limestones of Ireland cannot be worked like the soft oolites of England: a tooth saw or drag would merely scratch them, so that dressed work must be wasted down from the rough block, which is first roughly hammer dressed ("scabbled") to the sizes required. There are 13c. ft. of limestone to the ton, and it can be obtained in rough blocks f.o.b. for 6s. per ton, or about 5½d. per cubic foot. It would be worth while to give the stone a trial in London, as, in addition to its being a good weather stone, it is non-porous, and would not hold the "blacks" washed out of its smoke-laden atmosphere. Quarry proprietors frequently furnish architects with analyses of their building stones; but it will be seen that such information is no guide whatever to their weight-carrying or weathering properties under ordinary conditions. If a stone is sought from which lime or cement is to be obtained, then its chemical analysis becomes a matter of the first importance. The same may be said of a stone required to line a kiln, or as a flux for iron ore. Under other circumstances a knowledge of the chemical constituents of a stone may be misleading, although it is always interesting.

DONEGAL.

The rocks here are Middle Carboniferous Limestone with shale and sandstones; Lower Limestone with dolomite; Lower Limestone shale and calciferous sandstone (289, 292, 305, 324); Old Red Sandstone; Crystalline Limestone (266, 329), steatite, micaceous and chloritic schists and sandstone (311); Quartz Rock (273), Altered rocks of Silurian age; Granite Basalt and other igneous rocks. Ballyshannon is built on Lower Carboniferous Limestone with dolomite and quartzite. Donegal: Calp. Basalt. Letterkenny: Metamorphic schists, Alluvium. Lifford: Alluvium and Schistose Metamorphic rocks. Between Donegal and McSwyne's Bay there is a tract of Lower Carboniferous sandstone extending inland to the north of Lough Eask. This is bordered by a narrow margin of Old Red Sandstone; all the rest of the county is occupied by altered Crystalline Limestone and Sandstone of Silurian age, and igneous rocks. There are two types of Lower Silurian rocks in Ireland, as there are in Scotland, one consisting of schists, sandstones, slates, and beds of limestone as they were deposited, and the other of crystalline limestones, quartzite, and schistose rocks altered by metamorphism, which in this case was due to the action of intense heat, steam, and pressure. In Donegal, and other northern counties, shales and slates have been converted into schists, sandstones into quartzite, and shales and grits into granite; in the southern counties the rocks are unaltered. Crystalline rocks therefore form all the Highlands of this county, and they are of the same geological age as the ordinary rocks of the Chair of Kildare and other places, both being represented in Wales by the "Bala Limestone." In the centre of Ireland the Lower Silurian rocks pass under the great sheet of Carboniferous Limestone found there; where they emerge on the south, the strata are of the ordinary fossiliferous type; but in the north, where they rise into hills and mountains, they are seen as crystalline schists, quartzite, and granite formed by the fusion of the same rocks. Kinahan says that the metamorphosed rocks of Donegal are supposed to be of Cambro-Silurian age, and it may turn out that some of them are Cambrians, or even Laurentians. The whole series are interesting and peculiar, as some of them are metamorphosed eruptive rocks, so that in the same areas there are altered eruptive and altered sedimentary rocks: these include Opelite, Ophiolite, Steatite, Eklogite, Onkosin, Pyralolite, Magnesite, Epidosite, Sepiolite, Meerschaum, and others. The Donegal hills therefore afford a rare collection of ornamental building stones, many of which are at present wholly unknown to the trade.

The newest rocks here are the Carboniferous, and they furnish the builder with limestones and

sandstones. The limestones are found covering small areas near Donegal and Ballyshannon; but they are not much used, except for lime-burning. The Donegal stone is an earthy, greyish, black calc; and that quarried at Ballyshannon, which works freely, is greyish-blue, compact, rather earthy, and semi-crystalline. Ballyhanna stone, quarried near Ballyshannon, is a grey magnesian limestone on the north side of the river Erne, and a dark limestone on the south side. It has been used in all the buildings of the neighbourhood. The R.C. chapel and infantry barracks at Ballyshannon were built with limestone quarried close to the town. A quarry in the same rock at Laghey, which furnished stone for the Methodist chapel in Donegal, is now closed. The limestone was hard and flinty, though it was easily quarried, on account of its being well bedded: it worked badly—the colour is a dark grey, nearly black. The most important building stones in the county are the Carboniferous Sandstones, and amongst these the Mount Charles stone is the most celebrated; the name of the quarry is “Drumkeelan.” This is a greyish brown felspathic sandstone, slightly micaceous with siliceous ferrous cement. The late Mr. Cockburn, an extensive Dublin contractor, said of the Mount Charles stone: “It is a good durable stone, hard to work.” Unfortunately this opinion is not borne out by the present condition of the Dublin National Library and Museum, where this stone was used only a few years ago, for many of the balusters in the parapets are in an advanced state of decay, and in every place where water hangs, as under projecting sills, &c., the stone shows unmistakable signs of failure. The ashlar walling here is of granite and the dressings of sandstone apparently because there was some saving of cost in this arrangement of the materials. The state of the marble panels on the drum of the reading-room shows the utter absurdity of using coloured marbles polished for decorative purposes out of doors in this climate. The Drumkeelan Quarry, which is three miles from Mount Charles Pier, also furnishes paving, which is much used in the town of Donegal. The other Carboniferous Sandstone quarries are Lettercran, three miles from Pettigoe, used in the stations on the Enniskillen and Bundoran railway; Altito, three miles from Donegal, a dirty yellow, hard, quartzose, and semi-crystalline stone, with a felspathic cement, used for walling in Lough Eske Castle; Beauwin, uneven in grain, with large quartz pebbles. Some of the beds are of fine texture and good colour: surface stones are chiefly worked here. Kildoney, four miles from Ballyshannon, white, micaceous, and siliceous, works fairly well, used for walling; Dogs Mountain, a free-working, cream-coloured, fine-grained ferruginous stone, sufficiently well bedded to be used for flagging; it was used in Ballyshannon Parish Church. In a ridge of Calp sandstone near Bundoran good free-working stones are obtained, which may be seen in many buildings in that town. The next rocks in descending order are the Lower Silurians, and they furnish the builder with limestones and sandstones more or less metamorphosed. The limestones are sometimes of a kind well suited for dressings, and they may be polished for marble; but unfortunately the grain of the rock is coarsely crystalline, or fine when it is thin bedded, and so full of joints that it can be raised in small pieces only. These metamorphic crystalline limestones may be found in the following quarries. Ballymore: Cream-coloured, crystalline, takes a good polish; though difficult to work, it makes good dressings. Glaisheen, pink and white, clouded with grey; slightly schistose, but may be polished. Rockhill: The pyrites in this stone discolours it on exposure; it is a grey colour, and micaceous. Rineevin: Greyish, highly crystalline; a good stone. Dunlewy: Creamy-white, pink, with blue and green tints; the tinted stones, being in thin beds and much jointed, are of little value. A hard white crystalline stone was raised here for the church which stands near the quarry. It is a good weather stone, and keeps its colour. Other quarries in these altered limestones are Lettery, Fintown, Glenveagh, Lough Akibbon, Drumlagh, Ardunawark, Magheraboy, Cloghroe, Cullancon, Kiltale, Magherasolus, Crauford, Kindrumlough, Tamney, Kintale, and Hillhead. These quarries furnish white, pink, cream, and bluish-grey crystalline limestones suitable for dressings or decorative work when polished. Detailed information about them may be seen in papers of the Royal Geological Society of Ireland by Professor Kinahan,

who is the best authority on the subject, as he has not only considered it theoretically, but also practically, so that any person looking for building stone should be guided by his advice in searching for a suitable quarry site. The Lower Silurian arenaceous rocks are chiefly quartzite; but some unaltered sandstones are found in the Raphoe and Rathmullen districts, and these, too, have been used for building. Some of the quartzite quarries are Muckish, Rineevin, Errarooney, Minnagran, Carrick, and Killyclug. The stones vary in colour from pure white to brownish and yellowish grey, many being suitable for walling and dressed work. There have been many attempts made at slate quarrying in this county, the most successful being at Glentown, two miles west of St. Johnstown, where slates were worked, on and off, for over 100 years; being used locally or shipped to Glasgow. The vein here is crossed by so many joints that large slates cannot be obtained, the largest being about 2ft. long and from 4 to 12in. in width: the colour is dark grey, and the “ring” of the metal good. This quarry was closed in 1879. Slates are also found in the following places:—Dunwiley, Thorn, Milford, Strawbridge, Carrick Macrolly, Dunmore, Buncrana, and Fahan Point. There were no slate quarries worked in this county in 1850, nor are there any worked at present. The igneous rocks, which are found thrust up through the stratified silurians (the latter being bent and folded as if subjected to some great lateral pressure), consist almost wholly of granite and gneiss. It is evident that in this locality the older stratified rocks were thrust up and contorted by the invasion of granite. That they sometimes lie unconformably on each other is the result of denudation; in fact, each successive layer of the silurians here was thrust up and altered in turn, volcanic action being almost continuous during this geological period. The granite is therefore not all of the same age, as it is certainly not of the same origin, the older intrusive granite being found to the west near the sea by Dunglow, and in the Barnesmore Hills north east of Donegal town, whilst the younger granite occurs entangled with schists in Kilmacrennan and Inishowen. It was thought at one time that granite was a kind of primary rock; the solid part of a liquid magma, which filled the centre of the earth; but it is now known that nearly all granites were at one time stratified rocks, and that they have been altered by intense heat and pressure. Slate rocks and grits, if melted and cooled down slowly under certain conditions, will form granite, and no primary granite is now known. In the western part of the country there are dykes of metaphyre or dolerite of the same age as the basalt of Antrim, which is post-cretaceous. These rocks are in some places found to be suitable for cut stonework. The granites are found in all colours, dark (almost purple) red, rich bright red, salmon, pink, rose, silvery grey, deep grey, blue, and green! That such an immense store of valuable decoration and constructive material should remain so utterly unknown and neglected seems almost incredible, a state of things that can only be accounted for by the extraordinary political, social, and economical conditions prevailing in Ireland at the present day, and which apparently tend to the extinction of all native industry. In 1859 there was only one granite quarry worked in Donegal, that at Dungloe. This quarry was scheduled last year as being still in work by the Donegal Granite Quarries Co., but it is now stopped. Another granite quarry, that at Carnagore was also scheduled as being worked by Mr. O. Battie, of Bradford, Yorks, with 29 men; but this is also closed, and at present no granite is raised in Donegal, whilst thousands of tons come here yearly from Sweden and Norway. Some of the most noted granites are Barnesmore, a red which was worked into dressings and monumental work at Bessbrook in Armagh. There is also a grey granite in this district. Minnagran is a gneiss rock, grey, coarse, and difficult to work. Dungloe, an even-grained granite which is easily quarried, as it has regular beds and joints, but still yielding blocks of large size. The colours are a rich red, changing through pink and rose to silvery grey. In the Rosses there are light and dark red granites at Burton Port, Leckene, Lefinn, and Garron Hill. Some of the Duogloe granites are grey, that at Lough-na-Geeragh is white. Croach-na-shollog, near Dunglow, is very red, and may be obtained in large blocks. Glenveagh, foliated, hard, durable, used in Glenveagh Castle; Barnesbeg, grey and red,

even-grained, works well; Magherararty, Bloody Foreland, grey, easily marked with sills, quarries, and other dressings; Torries, Arran Island, coarse, pink, with hornblende; Finford, grey and pink, suitable for dressings and polished work; and Lackagh Bridge, gneiss of a pink shade, which works well into dressings and ornamental slab. The Earl of Leitrim sent several granites to an exhibition held at Olympia in 1888; all these were quarried around Mulroy Bay, the colours being pink and grey. Many of the Donegal granites are obliquely foliated, like the accompanying quartzites and sandstone, and this has led to the belief that the granites were originally sandstones which passed through the intermediate stage of quartzites. Some of the granites described here are more or less “gneissose.” Gneiss, when typical, is a granular aggregate of quartz, felspar, and mica, occurring in plates or layers parallel to each other. Accessory minerals are frequently found which interfere more or less with the regularity of the layers.

PRESERVATION OF TIMBER.

SEVERAL processes have been introduced to render wood less liable to natural decay. The method of saturation is one of them. The mechanical saturation of wood is a comparatively new process, and was first tried thirty or more years ago, by means of an apparatus designed to saturate timber with preservative solution. Several preservative processes are in use, and in Germany and the United States they are numerous. The principal aim is to get rid of the sap-water so favourable to the propagation of germs; attempts have been made to liquefy the real sap and suck it out by vacual extraction. The principal steps in the process of saturating timber are as follows:—(1) To introduce steam to liquefy the sap; (2) afterwards to remove the substances liquefied by vacuum pumps—an operation requiring a long time, many hours; (3) to fill the cylinder with a preservative solution, allowing it to impregnate the wood as far as possible; (4) applying hydraulic pressure to assist the saturation. Such is the type of apparatus and process used for the purpose. The long time necessary to saturate the timber, often thirty hours or more, and the difficulty of reaching the heart of the timber; the serious injury done by steaming and exhaustion of the sap, and other objections to the chemicals introduced, besides the cost, are reasons that have been urged against the process. A newer process has been used, and is described thus: “The cylinder, instead of being 84in. diameter, is 50in. diameter and 112ft. in length; the cylinder body is made of cast-steel flanged sections, 2½in. thickness, with a special hydraulic joint at the flanges capable of enduring a hydraulic pressure of 1,000lb. per sq.in.; at each end is a domed gate with a vertical hydraulic cylinder superimposed, which operates a vertical gate-valve weighing 5 tons. The gate has phosphor-bronze rings. When the internal operating pressure comes upon the gate, these ring surfaces coincide, and the joint is perfect, whether with 10lb. or 1,000lb. pressure; the greater the pressure the tighter the joint.” The hydraulic accumulator is loaded to the normal saturating pressure for each kind of wood. For white pine the saturating pressure is 300lb., yellow pine 350lb., ash 400lb., chestnut 400lb., beech, birch, and maple 450lb., oak 650lb., and the direct saturation by this machine is 1in. thickness, and can be performed under these pressures because of the absorption of shock from pressure pump, with perfect results to the wood, and in much less time than required by the old system. The wood is simply put into the cylinder, the gate is closed, the cylinder is run full of saturating liquor, pressure is applied, liquor is returned to the tank, the timber is run into a dry kiln, and another charge of timber is run into the cylinder. Chloride of zinc is said to be a good preservative for railway ties, and may be used as the first solution, or sulphate of zinc, which is cheaper. Practical experience has proved that for wood exposed to weather conditions no treatment would be permanent except one, that would create a chemical double decomposition in the interior of the wood. The secret of the improved process is to admit the liquor under pressure, so that it will pass longitudinally through the timber and find its exit through an opening in the gate; the water on the wood will be driven out before the liquor, and the liquor in full strength will follow. The small valve in the gate is then closed and the

pressure is kept up on liquor entering the end of tie; the natural traverse of the liquor is radial to its longitudinal axis, and it goes out through the medullary rays to the surface of the tie evenly. Then a second chemical solution is applied, the whole surface of tie is enveloped in it, a pressure is put on the liquor which will saturate the tie compressionally and thoroughly, and the last chemical mingling with the first produces a double chemical decomposition, filling the cells of the wood with an insoluble substance, which renders impossible the exit of the chemical from the wood under any weather conditions. This second chemical may be chloride of calcium, which pens in the chloride of zinc by the nearly insoluble sulphate of calcium. Such is, in brief, the substance of a paper by Joseph H. Ferrell, discussed at a meeting of the Engineers' Club, Philadelphia.

TOWN AND COUNTRY HOUSE DRAINAGE.*

EVERYONE connected with house building knows well enough that sanitary requirements cannot be ignored with impunity. It is, however, equally certain that a very large number of even important houses are little better than death-traps in this respect, particularly in places beyond the immediate control of town authorities, though even in the heart of cities and crowded areas unless an immediate nuisance is in evidence little can be done to mend matters. An instance in point may be mentioned. A large London house in the West-end was being improved and done up, and amongst other things the architect had to examine and report upon the drainage. The house had always been in the hands of people with ample means, and never, in all likelihood, would any but West-end builders have been employed upon the premises, which to all appearance had been continually well cared for. It was found, however, that no trap had ever existed between the sewer and the house drains. What was calculated to make matters worse was the fact that the street sewer had some years before been lowered, and the branch drain in question had been then connected with it by a vertical pipe entering the sewer into its topmost crown; consequently the sewer gas was afforded every facility for escape into the house referred to. The strangest part of all is that the aforesaid drain passed through the premises, up the outside at the rear, and terminated in a w.c. situate in the midst of the bedrooms at the top of the house. The sewer gas in this instance was thus laid on to the building in the most perfect fashion; still no one had died or were even ill in consequence, so far as could be ascertained. The only palliative was a big sweeping staircase right up through the building, which acted as a shaft or lung, so to speak, for upcast ventilation. Drain ventilation there was none, and in the floor of the basement a bell gully trap occupied a central position, with all the risks which need not be enlarged upon here.

Mr. G. A. T. Middleton has just brought out a little volume published by Mr. B. T. Batsford, of Holborn, which supplies a well-arranged series of chapters dealing with the subject of house drainage in town and country, accompanied by illustrations of a variety of traps, closets, pipes, junctions, manholes, baths, sinks, and all the rest of it, making matters clear, and adding suggestive ideas as to flushing, testing, and reporting upon drains, as well as by-laws referring to sanitary requirements. Septic tanks and disposal methods are described, and a variety of information collected from various makers of sanitary appliances is added. These is also an outline specification for drainage works. Anyone dealing with undertakings of this kind can only do so, of course, successfully after experience. The learner, however, will find Mr. Middleton's book efficient, and to serve its purpose, and for the student's use we confidently recommend it.

AN ARMoured CONCRETE BUILDING FOR THE COLLEGE OF MUSIC, CINCINNATI.

THE College of Music, Elm-street, Cincinnati, had two halls for public concerts and similar purposes, which were destroyed by fire in August, 1902. When it was decided to rebuild at least

Some of the Concrete Steel Details of the College of Music, Cincinnati.

one of these, the consulting architect strongly advised the use of a fireproof construction, although there was not enough money in the treasury to pay for the additional expense. It was found, however, that armoured concrete could be used to make the hall fireproof at a cost not greater than that of steel girders and wooden floors.

The new recital hall is 60ft. 7in. wide by 80ft. long, and has in front a stage and in the rear a balcony, both extending across the entire building without an intermediate support. The roof is of armoured concrete construction, consisting of a 4in. concrete slab braced by ribs 15ft. apart, supported by four concrete girders 12in. wide by 48in. deep, spaced 16ft. apart. The gallery is carried by one concrete girder 12in. wide by 32in. deep and another of the same width but 43in. deep, both having a clear span of 60ft. 7in. At the staircase, the balcony is supported by 8in. by 16in. girders. Accompanying illustrations show a plan of the balcony, a section of the hall at the balcony, and the reinforcement of girder G16. The depth of this girder is but 2ft. 8in., so as not to encroach on the already very small clear height from the floor to the bottom of the girders.

The girder contains in its lower half eight 1 1/2in. steel rods, four of which are straight and four bent at the third points of the span, the latter reaching the top of the girder near the supports. Around each pair of rods are ranged a number of hoops, 3/4in. wide, of No. 16 steel, bent into the shape of a U, spaced from 5in. to 24in. apart. These hoops take up the horizontal shear in the girders, and are therefore spaced closely together near the supports.

As the balcony floor at girder G16 was not of a large enough section to take up the compression in its upper part, four 1 1/2in. rods were there embedded to take up that part of the compression which was not provided for by the concrete forming the floors. These compression rods are kept from buckling upwards by pairs of 3/4in. annealed wire rods, 2ft. 6in. long, spaced 24in. apart. These wires were embedded in the concrete before the top rods were laid in place, and afterwards the 1 1/2in. rods were surrounded by concrete. The wires of each pair were twisted together and prevent lifting of the rods through their adhesion to the main body of the concrete. For the lower part of the beam the concrete used was in the proportion of one part cement, two parts sand, and three parts crushed gravel, 3/4in. size and under. For the upper part of the beam, 1 : 2 : 4 concrete was used.

Girder G17 is situated much higher above the floor of the hall, and could have been made 3ft. 9in. deep; but as the floor area to be supported was much greater, the same size and number of bottom rods were used as in girder G16. The greater width of the floor allowed a reduction in the number of compression rods to

three. The floor between girders G16 and G17, as shown in the section of the balcony, makes a considerable bend at about the centre of the span. It was made 6in. thick and reinforced by 1/2in. rods, 8in. centre to centre, placed about 1/2in. from the bottom of the floor. The concrete used for this was in the proportion of 1 : 2 : 5.

The girders supporting the roof are reinforced by the same number of top and bottom rods and steel hoops, as in girder G16. The roof proper is divided by 8in. by 12in. beams into nearly square panels, 4in. thick and reinforced by 3/4in. rods, 9 1/2in. centre to centre, in both directions. The roof girders are nearly 30ft. above the floor of the hall. The supports for the moulds consisted of pairs of 2in. by 6in. uprights placed 5ft. centre to centre, and heavily braced together. The bottoms of the moulds were 2in. planks suspended from 2in. by 6in. cross pieces nailed to the verticals, and the sides were 3/4in. matched boards fastened to the 2in. by 6in. uprights and stiffened sideways by intermediate frames. To support the centring for the roof slabs 2in. by 10in. planks were run between the girders about 2ft. 6in. apart. The centring for the beams was struck four weeks after the concrete was placed. The roof girders deflected under their own weight and that of the roof slabs but 1/4in. Girder G16 deflected 3/4in. and G17 but 1/4in.

Girders G16 and G17 were figured for a floor load of 90lb. per square foot. They were tested on August 25, 1903, by a load of 50,000lb. The load was distributed over both girders in approximately the proportion of the live load to be carried by them. The greatest deflection produced was 3/4in., which is nearly 0.0025 of the length of the span, certainly a remarkable performance. The deflection did not increase for the two days the load was applied.

Atlas Portland cement was used throughout the building, which was finished, together with a four-story school building, within three months after the signing of the contract. Mr. G. W. Drach, Union Trust Building, Cincinnati, was the architect. Mr. L. J. Mensch, civil engineer and contractor, Monon Building, Chicago, designed and contracted for the concrete work under the Hennebique patents, for which Mr. L. Eid, Cincinnati, was the subcontractor. This example shows the adaptability of concrete-steel to the rapid construction of moderate cost fire-resisting buildings.—*The Engineering Record.*

At St. Paul's Church, Thornton Heath, General Crabbe has unveiled a stained-glass window as a memorial to the men of the parish who served in the South African War.

The Primitive Methodist chapel and Sunday-schools in Parchment-street, Winchester, a large block of buildings on the site of an old independent chapel and a demolished house, were opened on Thursday in last week.

* The Drainage of Town and Country Houses: A Practical Account of Modern Sanitary Arrangements and Fittings. By G. A. T. MIDDLETON, A.R.I.B.A. With ninety-three diagrams (4s. 6d. net). London: B. T. Batsford, 1903.

ILLUSTRATIONS.

NATIONAL PRIZE DRAWINGS FOR COLOURED PRINTS FOR CHILDREN'S BOOKS.—THE PASSMORE EDWARDS POLYTECHNIC, CAMBERWELL.—HOUSE AT GARSTANG.—SELECTED DESIGN FOR ACTON COUNTY SCHOOL.—METHODIST FREE CHAPEL, NUNEATON.—OLD CASEMENT FASTENERS.

Our Illustrations.

PRIZE DESIGNS FOR COLOUR PRINTS FOR CHILDREN'S BOOKS.

THESE sheets are very decoratively treated, and make seasonable subjects for illustration, marked as the designs are by a recognition of fun, as well as a certain conception in the graphic representation of the subjects selected, and also for the feeling with which they are rendered. We have chosen Miss Eugenie Richards' prize drawings for this reason, and can but commend her skill and inventiveness in investing the characters of such well-worn stories with freshness and with no little power of delineation. They are intended for a child's book of Nursery Rhymes in black and white, or they would serve as the keys for colour prints to be reproduced in four or five tints. The series received a prize at the National College of Art last summer.

DETAIL OF TURRET, PASSMORE EDWARDS' POLYTECHNIC, CAMBERWELL.

THIS building is now nearing completion, and occupies an important position in the Peckham-road. We gave a reproduction of the front elevation from the architect's drawing, which was shown in the Royal Academy last summer, and it will be found in the BUILDING NEWS for May 22. To-day a detail shows the central turret, which is made of teak, the roof and lower body being sheeted with lead. The sun and moon, which are gilded, were specially modelled by Mr. Dalton, the Principal. Mr. George Wragge made the wrought-iron finial. Mr. Horsmann did the carving. The turret serves as an exhaust ventilator to the workshops, the air flues being brought together into one shaft. The builders are Messrs. F. and H. F. Higgs, of Loughborough Junction. Mr. A. E. Biggs is the clerk of the works. The architect is Mr. Maurice B. Adams, F.R.I.B.A.

HOUSE, GARSTANG, LANCASHIRE.

THIS house is well situated, overlooking the Grisedale Fell's. The walls are of Accrington bricks with stone dressings, relieved with half-timbered work, and the roofs are tiled. The upper floors contain eight bedrooms and two dressing-rooms, with the usual offices. The internal fittings have all been specially designed by the architects, Messrs. Garlick, Sykes, and Catterall, Preston, and the work has been well carried out by the builders, Messrs. Hatch and Sons, Lancaster.

ACTON COUNTY SCHOOL FOR BOYS.

THE accompanying view and plans illustrate the above new day schools proposed to be erected by the Middlesex Education Committee on a site between High-street and Mill Hill-road, Acton. The scheme includes an assembly hall, eight class rooms, chemical and physical laboratories, an art room, headmaster's room, and a common room for the assistant masters. There is a dining hall for

a proportion of the boys in the basement with the necessary kitchen, &c. The architect of the work is Mr. A. Hessel Tiltman. The price named in the competition was £8,000. The competition drawings from which this design was chosen will be on view in the Priory School, Acton, from Dec. 28, till Jan. 2, when the Town-hall competition designs will also be open to the inspection of the public. The school designs have not yet been seen by the competitors.

FREE METHODIST CHAPEL, NUNEATON.

THE accompanying view shows the Free Methodist Chapel, Heath End, Chilvers Coton, Nuneaton; also the ground-plan. The building has recently been commenced. The builder is Mr. George Smith, of Chilvers Coton, and the contract is £1,450. The walls are faced with the best red bricks, relieved with Bath-stone dressings and roof slated with Bangor slates. Mr. T. J. Yates, of Birmingham, is the architect.

OLD CASEMENT FASTENER, SALFORD HALL, EVESHAM.

WE shall shortly give some illustrations of this interesting mansion house, of Late 15th-century date. The main existing part, which included all the principal rooms, was commenced in 1602. We shall give further particulars, with the general drawings, which Mr. Hubert Hulme, of Bedford, has sent us. To-day we publish some capital details, sketched on the spot, and forwarded by Mr. Hulme, illustrating a selection of casement fasteners and some pairs of iron hinges from doors and cupboards. They are none the less suggestive and useful because no further description is needed.

CHIPS.

A central free library for Greenwich is about to be built in Tunel-avenue at an estimated cost of £6,500. The architect is Mr. Sidney R. J. Smith, F.R.I.B.A., York Buildings, Adelphi.

The community of English Redemptorists have purchased Windhill House and St. Katharine's High School, Bishop's Stortford, with five acres of ground attached, for the purposes of a monastery. A new Roman Catholic Church is eventually to be erected in the grounds, which adjoin the parish church.

The Duke of Bedford, who is having extensive alterations made to the parish church of Woburn, Bedfordshire, at a cost of several thousand pounds, has presented a new organ and a peal of bells. One of the bells is the largest in the county, weighing 55cwt.

Mr. W. O. E. Meade-King, an inspector for the Local Government Board, has held an inquiry at the Town Hall, Decbigh, into the application of the town council for a loan of £15,000 for a new system of drainage for the town. The council propose to become first tenants of Eglwsen Farm, in order to use the whole farm for sewage irrigation purposes, sub-letting it to the present tenant. Mr. Bailey Denton, C.E., the special engineer of the council, gave evidence as to the absolutely bad and defective state of the present sewers. Alderman John Davies (a former surveyor) suggested that the town drains might be rectified, and only the Ruthin-road portion to the outfall made anew. The inspector remarked that the Local Government Board would never agree to certain methods of improvement Mr. Davies suggested.

With a view to facilitating their Irish traffic, the Great Western Railway Company are building a new harbour at Goodwick, on the south side of Cardigan Bay, and when this is completed it is the company's intention to transfer to it the whole of their plant and works at New Milford, the locomotive, engineering, passenger, goods, and cattle traffic, and the marine department. A breakwater is being carried into Fishguard Bay, and has now reached a length of 1,000ft. from the shore. The operations are being conducted by the company without the intervention of contractors.

A public memorial will be erected in the Queen's Gardens, Warrington, in commemoration of the services of the South Lancashire Regiment, Line Militia, and the Volunteers during the South African War. The memorial will take the form of a statue of the late Colonel O'Leary, as he appeared when leading the first battalion of the regiment in their charge at the storming of Pieter's Hill, which cleared the way to Ladysmith.

After a hearing lasting four days, before his Honour Judge Percy Gye, the Corporation of Newport, Isle of Wight, who are conservators of the River Medina, have been mulcted in £50 damages for the demolition of a building, the property of a barge owner named Cooper, which the Corporation alleged was on the foreshore. His Honour also granted an injunction, restraining the Corporation from further trespass.

COMPETITIONS.

ACTON.—The town-hall and municipal buildings competition drawings will be on view to the public in the Priory-road Schools, Acton (close to High-street), during next week from Dec. 28 to Jan. 2. The competitors are Messrs. Maurice B. Adams, Arthur Ardron, H. T. Hare, W. G. Hunt, Lancaster Stewart, and Rickards, C. E. Mallows, and Russell and Cooper. Mr. Hunt's scheme has been chosen on the advice of Mr. McVicar Anderson. At the same time the designs submitted for the Acton County School will be on view, including the chosen design illustrated herewith to-day, so that the collection of drawings to be shown will represent a double event of unusual interest.

UNITED METHODIST FREE CHURCH AND SCHOOLS, SEVEN KINGS, E.—The competitive designs submitted by Messrs. George Baines, F.R.I.B.A., and R. Palmer Baines, 5, Clement's Inn, Strand, W.C., have been adopted for the above church and schools, and the first portion of the building, which embraces the nave of church, including tower and temporary apse, &c., is to be proceeded with at once; also the schoolroom and two classrooms form a portion of the scheme. The estimated cost of this first portion is £3,641. The materials are to be: facings in red brick, dressings in bath stone. The tower, which is a square one, surmounted by open traceried parapet and spire, forms a prominent feature of the design.

At a meeting of the donors to the Albert Fry Memorial Fund held at University College, Tyndall's Park, Bristol, it has been decided to complete the college buildings by the erection of a memorial tower and north wing.

Alderman G. White, M.P., President of the Baptist Union has opened the new Sunday-schools erected by the Baptists in Winner-street, Paigot. The buildings have been erected at a cost of £550 on a site opposite the Baptist chapel and the existing Sunday-schools.

The county surveyor for Down has been directed to examine and report to the Law Committee of the County Council with reference to the proposed extension of the tramway system from Belfast to Holywood.

At a meeting of the Eastern District Committee of Stirling County Council, held at Falkirk on Friday, plans were submitted of the new County Council offices proposed to be erected in West Bridge-street, Falkirk. The plans, which were approved, show a handsome building to cost £8,000, including the cost of the site and the price paid for the old properties upon it.

A stained-glass window has been placed in the west end of Thornghumbald Church, near Hedon, as a memorial. The window takes the subject of John the Baptist.

The General Purposes Committee of the Woolwich Borough Council have approved of plans for a new Woolwich Arsenal railway station, and preparations will commence with the advent of the New Year.

The sanitary committee of the city council of Newcastle-on-Tyne approved on Monday of plans for the enlargement of the fever hospital at Walker, at an estimated cost of £53,000.

The Bermondsey Borough Council have acquired possession from the London County Council of a large plot of land situate by the Tower Bridge-road, which will be converted into a much-needed open space for the neighbourhood.

Lieut.-Col. W. H. Wellsted, of Hull, has awarded the Scarborough Corporation £1,950 in an arbitration as to the value of a portion of the new recreation ground, Manor-road, sought to be acquired by the North-Eastern Railway Co. for constructing new sidings on the Scarborough and Whitby line.

A stained-glass window has been placed in the south aisle of Brewood Church to the memory of the late Rev. Edward John Wrottesley, who was vicar of the parish from 1863 to 1901, and prebendary of Lichfield and rural dean. The window has three lights, and the subjects depicted relate to Abraham, Isaac, and Jacob. The artist is Mr. A. J. Dix, of Berners-street, W.

Mr. W. T. Paulin has presented the district of Winchmore Hill, near Enfield, with a parish hall, costing £15,000, as a memorial to the late Mrs. Paulin. The opening ceremony was performed by the Bishop of London on Saturday.

A processional cross has just been completed for Exeter Cathedral from designs of Mr. G. H. Fellows Pryne, F.R.I.B.A., of London. It is worked in repoussé silver, and enriched with ivory panels, jewels, and enamels. The design is of English Decorated character.

RESEARCHES IN CRETE.

A LECTURE was recently given under the auspices of the Sheffield Society of Architects and Surveyors, as briefly mentioned last week, in the lecture-hall of the Sheffield Literary and Philosophical Society, by Mr. Theodore Fyfe, of London, on "Recent Excavations in Knossos, in the Island of Crete." Mr. T. Winder occupied the chair. The lecturer, whose address was illustrated by lantern slides, reminded his audience of the fact that in 1900 Dr. Arthur Evans acquired full rights of digging over the central part of the Knossos hill. Since then the work of excavation has proceeded steadily for four seasons, and there seems every prospect of a fifth. A great palace has been brought to light, larger than any others of the Mycenaean age, on the mainland of Greece, belonging to a period anterior to these, but in many ways historically connected with them. The evidences of an extensive town have also been found in the vicinity of the palace. The amount of material that has been discovered is enormous. Probably no other site, either in Greece or Egypt, has yielded such a variety of small finds, many of which, as well as the architectural features of the palace, are new, and of the first interest. The term Minoan has been fitly applied by Dr. Evans to the earlier central style of Crete. The Minoan dynasty divides itself into early, middle, and late periods. The existing palace belongs to the later Minoan period, but building remains also exist of the middle period, which produced the finest pottery known in the Egean—exclusively Cretan, and undoubtedly the main source of all later ceramic styles known as "Mycenaean." Before Cretan exploration, from about 1500 to 1000 B.C. was generally accepted for the so-called "Mycenaean" age. The chief part of the existing palace at Knossos was probably all built before 1500 B.C., and stretches back beyond 2000 B.C.; the perfection of the Minoan style being probably reached at some time between these dates—about 1800 B.C. Two Egyptian finds at Knossos are evidence of intercourse between the earlier palace period and the shepherds' dynasties of Egypt. The latter palace period is more or less contemporary with the Egypt of Thothmes III. In plan the palace at Knossos is, broadly speaking, four-square, with a great central court, which, being longer than it is wide, roughly divides the plan into two portions—a western and an eastern—with connecting wings north and south. Rather more than half the palace is at the top of a hill, on a slight eminence commanding the land approaches. The remainder is on the more sheltered east slope, and it is to this steeply-sloping ground that we owe the most extraordinary architectural developments of the building. It is nearly certain that a portion, at least, of the deep part on the east slope was not less than three stories high.

In considering the plan of the palace in detail, the first thing evident is its domestic character. There is no attempt at exact regularity or symmetry. On the other hand, everything seems planned for convenience and comfort. The western portion consists mostly of basement in its present state. Here are the more public and administrative parts of the buildings, with ample magazines for stores, the judicial throne-room, and, to the west, a vast court, with the great ceremonial entrance, where the King may have sat in the gate. The other principal entrance is on the north, and evidences show that a great roadway must have existed here. The eastern portion of the palace contained the domestic quarters of the King and his family. Adjoining are the palace workshops and stores, perhaps kitchen apartments, and magazines for utensils. Here, also, must have existed a great system of halls entering off the western court. The western part of the palace is separated from the eastern by the central court, which was stone paved, but probably entirely open. The level of the central court is some 3 ft. above the existing or basement rooms of the western quarter. The palace in general dimensions is, roughly speaking, about 500 ft. square, and covers upwards of five acres. From the importance of its fresco finds, Knossos deserves the title of a second Pompeii. The evidence that it affords of a highly developed school of the arts is fully borne out by other finds—works in ivory, crystal, gold, enamelled porcelain, pottery, and fine stone. An astonishing capability of working in any material is evident. The art of painted plaster is extended to the production of full-sized reliefs, artistically superior to any hitherto known work of the period. This is all the more remarkable when we consider that this school

of the arts existed hundreds of years before the first beginnings of Greek civilisation. Another extremely important find consisted of some 1,600 clay tablets, inscribed with a highly-developed system of writing. These chiefly appear to be palace archives, in the form of accounts. The appearance of the palace in its pristine glory must have been very magnificent, taking into account the large scale and beautiful workmanship of the painted plaster, the fineness and brilliancy of the colouring material, and the effect of judiciously contrasted colours. The only things which can be compared to its frescoes out of Egypt, are some Roman paintings, certain Byzantine mosaics; and in our own time, some coloured tile work, some frescoes by Puvis de Chavannes, and some examples of the revival of coloured plaster relief, as for instance, Mr. Gerald Moira's work at the Trocadero Restaurant. But the ancient examples often show a perfection of relief which Donatello might have envied, and a permanence and brilliancy of colour which have remained quite unsurpassed.

IMPERVIOUS CONCRETE.

ONE of the subjects for discussion at the annual convention of the American Society of Civil Engineers was the question: "Is it possible to make concrete which will be impervious to water, and the best method?" Mr. Sanford E. Thompson, Assoc. M.Am.Soc.C.E., shows the possibility of making pure concrete of very thin section impervious to water by a visit to the filtration works of the East Jersey Water Company at Little Falls, N.J. A circular wall of reinforced concrete 15 in. thick at the bottom and withstanding a pressure of water of more than 40 ft. in depth without leaking, is mentioned. A tunnel between Boston and East Boston built below the harbour by the Boston Transit Commission by Mr. Howard A. Carson, M.Am.Soc.C.E., shows concrete laid in sections 30 in. in length. The arch and walls were 33 in. in thickness, and at high water the depth of arch below surface of harbour is about 70 ft. Soon after the air pressure was removed only slight percolation at the joints between the sections appeared, but were closed by forcing in neat cement grout under pressure. The essential elements for impermeability are stated as follows: An aggregate (including sand) proportioned for great density, an excess of cement, a wet mixture carefully placed, monolithic construction. The writer further remarks: "The addition of foreign substances, such as soap and alum, slaked lime or pozzuolana, has for its chief object the introduction of very finely divided matter into the pores of the concrete, and as long as the cohesion of the cement is not injured, it makes very little difference as regards the permeability, whether their action is chemical or mechanical." Clay has been suggested as a suitable material for increasing the density, as laboratory tests tend to show that a small admixture of clay increases rather than diminishes the strength of mortar. Mr. Feret has been conducting experiments to determine the effect of mixing by grinding together materials of a pozzuolanic character with cement to be used in sea-water, and has found that they improved the specimens.

A motor generating station, having an Italian terrace and garden upon the roof, is about to be built in Mayfair, W., on the plot of ground bounded by Balderton, Hart, Duke, and Brown streets. The architect is Mr. C. Stanley Peach, F.R.I.B.A.

The town council of Southampton have decided to carry out various works, including the extension of the Western Esplanade and the drainage of the Common, at a total cost of £2,500, so as to afford labour for the unemployed. The men engaged will be set to work under the direct supervision of the borough engineer.

A tender has been accepted for £5,247 to erect the Missions to Seamen Church and Institute, for sailors of all nations, at Wellington, New Zealand. The total cost, including the site, will be £7,800. On the lower floor will be the social hall, library, kitchen, &c., and on the upper floor the church, to seat about 450 sailors. The site is a corner one, near to the Supreme Court.

Mr. Henry Marc Brunel, M.Inst.C.E., of 21, Abingdon-street, Westminster, who was associated with Sir J. Wolfe Barry in the construction of the Barry Docks and the Tower and Connel Bridges, and died on October 7 last, aged sixty-one years, left estate which has been valued at £33,811 12s. 2d. gross and at £32,963 8s. 3d. net.

OBITUARY.

WE record with regret the decease of Mr. WILLIAM PAIN, F.R.I.B.A., of 60, Lincoln's Inn-fields, whose long and intimate connection with the Royal Architectural Museum was of the utmost possible service to that venerable institution, and which, under his appointment as liquidator, has only so lately been handed over to the Architectural Association. Mr. Pain for many years acted as hon. sec. of the Westminster School of Art held in Tufton-street, and without his co-operation and continued attention to the duties of the office the great success of that school would have hardly been possible. Only those who worked with Mr. Pain can ever know the amount of time and ability which he continuously rendered in the interests of both institutions. When the council of the museum determined to carry out the proposed free gift of the collection and buildings in the interest of improved architectural education, as above referred to, Mr. Pain was unanimously chosen for the position of liquidator. Owing to his long and serious illness, it is doubtful to what degree of completion the details of the transfer have actually been carried, though matters no doubt are in a very advanced stage, as the business-like methods which always distinguished Mr. Pain's conduct, we are well assured, will have left very few items in this business undetermined. Mr. Pain was a partner of the old firm of Lee Bros. and Pain, long in occupation of offices in Adelphi-terrace, Strand, and for a considerable period Messrs. Sydney Lee, F.R.I.B.A., and William Pain, F.R.I.B.A., have continued their practice in Lincoln's Inn-fields. The original firm built the well-known Italian Opera House in the Haymarket, which was pulled down to make way for His Majesty's Theatre. Messrs. Lee and Pain designed St. Katherine's Lodge, Regent's Park, and the new studios for the Royal Architectural Museum were erected from their plans for the Council. Several country houses and other buildings number among their commissions, and particularly for dealings with property and questions of compensation, light and air, and similar undertakings, Mr. Pain enjoyed a considerable reputation. He was a Fellow of the Surveyors' Institution, which body he joined in November, 1891; he had been a Fellow of the R.I.B.A. since 1875, having been elected an Associate in 1869. He was also one of the original members of the Architectural Association. His connection with Mr. Voysey's chapel may be mentioned. The funeral took place on Tuesday last, the 22nd inst., at Golder's Green Cemetery, Hampstead, where cremation was performed. Mr. Pain was sixty-six years of age, and he died at 40, Baron's Court-road, West Kensington, on Saturday last, the 19th inst.

CHIPS.

The Secretary of State for War has appointed Mr. H. F. Donaldson, M.Inst.C.E., chief mechanical engineer, to be the Chief Superintendent of Ordnance Factories, vice Colonel Sir E. Bainbridge, K.C.B.

The collection of pictures in the Maidstone Museum has recently been augmented by the purchase, through private subscription, of a water-colour painting by the late E. M. Ward, R.A. The subject is the "Battle of Aylesford between the Britons and the Saxons, A.D. 455," and the incident depicted by the artist is the end of the conflict between Horsa, the Saxon Chieftain, and Catigern, son of Vortigern, King of Kent. The painting is the original design for one of the large tapestries in Preston Hall, which was worked at the Royal Tapestry Works, Windsor.

The Scarborough Corporation have had under consideration the provision of bathing pools in the North and South Bays, similar to those which have proved so popular at Jersey. At Monday's meeting of the town council it was decided that plans of the proposed open-air sea baths should be made and submitted, and estimates prepared by the borough surveyor.

The Finance Committee of the Carlisle education authority have decided to pay the city surveyor, as their architect, £100 a year, in addition to the salary which he has already been drawing.

New diamond merchants' premises and suites of offices have been built in Ely-place, Holborn, as a block known as Andrey House. It has a superficial area of 13,824 sq. ft., and a frontage of 135 ft. in Portland stone, the style adopted by the architects (Messrs. H. H. and M. Collins, of 61, Old Broad-street) being Renaissance, freely treated. The building consists of five stories and a basement, and contains over 200 rooms. Double lifts and fireproof floors have been adopted. The builders were Messrs. Greenwood.

Building Intelligence.

BRISTOL.—The new offices of the Scottish Provident Institution, Clare-street, were opened on Monday. Messrs. Oatley and Lawrence, who are the architects, have treated the buildings in the Renaissance style. It has a base of Aberdeen granite, while the rest of the building is in Douling stone. A loaden dome, with moulded ribs and panels, which crowns the edifice, forms a distinctive feature. At the instance of the Streets Improvement Committee, the new building has been set back on the Stephen-street side, giving a much-needed additional width of about 5ft. or 6ft. The whole of the ground floor will be occupied by the Scottish Provident Institution officials, and the first and second floors and the basement will be let off as offices. The upper floors are approached by a staircase, which has a marble dado, while there are marble floors to the landings. The interior woodwork is of teak. The building contract was undertaken by Mr. R. F. Ridd, of Bristol.

EAST HAM.—The foundation-stone of a technical college to be erected in the Barking-road, East Ham, by the East Ham District Council, was laid on Friday. The new institute, which, with site and furnishing, will cost £20,000, adjoins the council's public offices, with which architecturally it will be in character. Above the basement will be rooms for building construction and kindred crafts and electrical laboratories; on the ground floor there will be an assembly room 35ft. by 30ft., with the offices of the secretary and class, reference, study, and common rooms; on the first floor will be the headmaster's rooms, demonstration apartments, and chemical laboratories. Towards the outlay £6,000 will be contributed by the Essex County Council.

EDINBURGH.—The new hotel of the Caledonian Railway Company, which occupies a prominent position at the west end of Princes-street, and has taken some years to build, was opened on Monday last. The new building has a frontage to Lothian-road of about 400ft., to Princes-street of 78ft., and to Rutland-street 176ft., and it is 110ft. high. The kitchen and servants' hall are placed in the basement next Lothian-road; they are lined throughout with white tiles. On the dark side of the corridor are arranged the wine cellars, and at the extreme end is the boiler-room. On the street floor is the entrance-hall, 38ft. by 30ft., which is panelled with mahogany. Opening off it are the grand staircase and hall, 45ft. by 40ft. The walls are lined with Pavonazzo marble, while the columns and pilasters carrying the corridor above, and rising from that to the roof, are of verde antico marble, with gilded Corinthian caps. The flooring is of black and white marble set in alternate squares. At the start there is one central stair 8ft. in width, but half-way up it divides itself right and left into two sections, which are continued to the entre-sol floor. The base of the balustrade is of dark-green marble, the centre of wrought iron heavily gilded, with the Scottish lion rampant introduced into the design, and the cope is of the light Pavonazzo marble. Opening from it on the left is a lounge, 45ft. by 22ft., and beyond is the dining-hall. It is 81ft. long, 31ft. broad, and 26ft. in height. It is in the Georgian style, and is divided into four bays corresponding to the four large windows by which it is lighted. It is panelled to a height of 11ft. in mahogany, and between each bay is a set of two fluted mahogany pilasters with Corinthian caps. The ceiling is of plaster work with floral enrichments. On the entre-sol floor are placed the reading-room and writing-room, 46ft. by 22ft., panelled in oak, the manager's office and the drawing-room, 62ft. by 26ft., decorated in the Louis Quatorze style. At the end of the corridor are the smoking-room, 40ft. by 27ft., panelled in oak, and a billiard-room panelled in mahogany, with two tables. There are five bedroom floors, on which are provided 191 bedrooms and twelve sitting-rooms for the public, and over seventy bedrooms—in the attic floor—for the staff. The first and second bedroom floors have each a corridor 31ft. in length. The architect was Mr. J. Dick Peddie, Albany Place, Edinburgh.

HUCKNALL HUTHWAITE.—The new church of All Saints, in the Common and Sutton roads, was dedicated by the Bishop of Southwell last week. The edifice is complete with the exception of the upper part of the tower. The walling stone was given by the New Hucknall Colliery Company

from their local pit, the material being obtained 400 yards below the surface, so that in more ways than one this is a colliers' church. Among the special gifts are the site, carved pulpit, choir stalls, brass eagle lectern, oak sanctuary chair; altar, oak litany desk, altar cross, professional cross, and a carved stone font. The building is entirely of the colliery stone, with Mansfield Woodhouse dressings, and the contrast is pleasing between the grey of the former and the buff tint of the latter. The style is that of the 14th century period of English Gothic, and, although seating over 500 people, the cost, including all oak furniture, chairs, &c., will not be more than about £3,600. The roof inside is covered with green stain. The builder was Mr. Clarke, of Nottingham. The carving and oakwork were carried out by Messrs. Braithwaite, of Worcester, and Messrs. Harry Hems and Sons, of Exeter. The entire church, as well as the embroideries, furniture, and fittings, was designed by Mr. C. Ford Whitecombe, A.R.I.B.A., London.

KELSO.—The new infectious diseases hospital, situated on rising ground at the Angroflat, an isolated situation to the north of the town, was formally opened on Friday by the Earl of Dalkeith, M.P. The hospital consists of two pavilions, with administrative block and laundry block. Each pavilion consists of two wards of three beds each, with duty-room for nurses in the centre, and a lavatory, &c., at the back. The wards are 36ft. in breadth, 16ft. in length, and 13ft. in height. The buildings are plain in design, but are constructed of stone. The work has been accomplished from plans prepared by Messrs. Sydney Mitchell and Wilson, architects, Edinburgh, at an outlay of about £8,000.

KIRTON HOLME.—The new Wesleyan chapel at Kirton Holme was opened and dedicated on Thursday in last week. It occupies a site adjoining the old chapel, which was erected in 1820, and which has been repaired and converted for use as a Sunday-school. The cost has been £610. The architect was Mr. W. Hinson, of Stamford, and Mr. J. R. Baker, of Moulton Chapel, was the builder. The new chapel is simple Gothic in style, with tracery heads to all the windows and doors. The dimensions of the building are 39ft. by 28ft. inside. Built on to the chapel is a minister's vestry, and outbuildings are provided. The chapel is built of red pressed bricks, relieved with Bath stone dressings, and will accommodate 166 people.

KIRKINTILLOCH.—The town council have now resolved upon the site to be acquired for the proposed town-hall and municipal buildings, for which they have in hand a sum of £4,000, collected by public subscription. The site to be purchased is in the centre of the business part of the town, with a frontage to Cowgate and Union-street. It is proposed to erect municipal buildings facing Cowgate, having departmental offices on the ground floor and a council-chamber above. Behind this building will be the halls, having access both from Cowgate and Union-street.

LANDORE, SWANSEA.—The Swansea Church extension scheme, inaugurated twenty years ago, has been further advanced by the opening and consecration of St. Paul's new church at Landore, an industrial district in the borough of Swansea, but in the parish of Llangyfelach. The church, which has cost £9,400, is designed to seat 600 adults, and consists of a nave 79ft. long by 11ft. 6in. wide; north and south aisles, each 76ft. long by 11ft. 6in. wide; chancel 36ft. 6in. long by 25ft. wide; organ chamber and clergy vestry. There are also a choir vestry, schoolroom, and classroom. The chancel is divided from nave by an arch. The choir stalls are executed in unpainted oak. The coloured marbles in the pulpit were selected to blend with the Quarella walls and Bathstone arches. Mr. E. M. Bruce Vaughan, of Cardiff, is the architect.

ROCHDALE.—The first sod has been formally cut on the site of the Church of the Good Shepherd in Eatwistle-road. The nave and aisles have been planned to accommodate 106 persons, but 471 could be seated on special occasions. There are to be two entrances, both on the north side facing Eatwistle-road. The style proposed is that of the end of the 13th century. The nave and the north and south aisles are all 60ft. long, the width of the former being 22ft. and the latter 11ft.; the total breadth of the church is 18ft., and the heights of the nave and aisles 37ft. and 25ft. respectively; the sizes of the temporary galvanised iron chancel and vestry are 22ft. by

81ft. and 12ft. by 81ft. The nave is separated from the aisles by a triple arcade, the clerestory above being 30ft. from floor, and the chancel by an archway with carved responds. The nave roof will be wagon boarded on arched moulded ribs. The west end shows a five-light tracery headed window with bell gablet above. The walls will be lined internally with pressed plastic lincoat brick, and externally with Yorkshire stone in random rock-faced level-bedded courses, the windows and dressings being of Hartham Park freestone. The floors are to be of wood-block arranged in patterns, and encaustic tiles in porch, while the roofs will be covered with mixed brown and red Brosley tiles, and the windows will be filled with tinted and bordered cathedral glass. The architect is Mr. E. H. Lingan Barker, of London and Hereford, and the contractor Mr. T. Pickles, of Luddendenfoot. The total cost will be £3,000.

WALTHAMSTOW.—The Palace Theatre will be opened on Monday next. The architects are Messrs. Wyson and Long, who have designed a building in the English Renaissance style, the imposing elevation having at either end a bold tower finished with stone and metal turrets, supporting flag standards. Under an iron and glass awning the main entrance opens into a spacious vestibule, which has a high dado of Austrian oak, with plastic decorations above, and a panelled and decorated ceiling. In front is a handsome box-office in polished walnut wood, to the right an archway, giving admittance to the stalls corridor, and on the left a broad staircase, the steps formed in mosaic and the walls of marble, leading to the balcony circle. The ground floor is divided into stalls and pit. Over the balcony, in which there are eleven rows, is a spacious gallery. The theatre being constructed on the cantilever system, an uninterrupted view of the stage is secured from every part of the house.

Among those who have accepted membership of Mr. Chamberlain's "unofficial" commission on fiscal policy are Mr. J. Howard Colls, principal of the well-known building firm of Colls and Sons, which has just been amalgamated with Trollope and Sons, of Pimlico, and Mr. S. J. Waring, jun., head of the firm of Waring and Gillow, furnisiers, of London and Liverpool.

A meeting of the council of the University of Birmingham was held on Friday, when the tenders for the erection of the superstructure of the three blocks and the great hall of the new University at Bournebrook, from plans by Messrs. Aston Webb, R.A., and E. Ingress Bell, were examined. Eighteen tenders were sent in, and that of Mr. Thomas Rowbotham, of Birmingham was accepted. The amount was not stated, but it was understood to be about a quarter of a million.

The London Traffic Commission, at their last sitting on Friday, heard evidence from Mr. T. W. Emden, past-president of the Society of Architects and Mayor of Westminster, who held that the construction of subways would solve the difficulty of the congestion of traffic in the principal thoroughfares. After hearing other evidence, the Commission adjourned till Jan. 7.

Colonel A. G. Darnford has held a Local Government inquiry at Harrogate with reference to the application for sanction to borrow £1,200 for works of sewerage and surface-water drainage in Knaresborough-road and Leeds-road.

The library committee of the Guildhall Corporation have accepted as a gift for the Guildhall Art Gallery an oil painting entitled "The Quarrymen of Parbeck," from the brush of the late Mr. H. T. Wells, R.A. The picture is the gift of Mr. Wells's two married daughters, and has been hung in the centre gallery.

Mr. W. J. Locke, secretary of the Royal Institute of British Architects, has written to Sir Lees Knowles, Bart., M.P., expressing the Council's appreciation of the fact that, with the object of preserving an old building of historic interest, he has lately purchased Turton Towers, an old hall near Bolton, Lancashire. Sir Lees Knowles has replied expressing his satisfaction at the R.I.B.A.'s approval of his action.

The sales at the Mart last week, as registered at the Estate Exchange, amounted to £60,030. For the corresponding week of last year the amount was £57,175.

An Oddfellows' Hall was opened last week in Fisher's - road, Totton, Southampton, by the Compton Lodge M.U.O. The chief room measures 58ft. by 26ft. The building has been erected by Messrs. Crook Brothers, of Eliug, from plans supplied by Mr. S. Kelway Pope, architect, of Southampton.

PROFESSIONAL AND TRADE SOCIETIES.

DUNDEE ARCHITECTS AND THE LICENSED VICTUALLERS.—A meeting of the Dundee Institute of Architecture, Science, and Art was held on Friday to consider a request made by the local Licensed Victuallers' Association for tenders for the preparation of plans for licensed houses in Dundee. This request has been made in terms of a decision by the magistrates that all license-holders should submit internal plans of their houses to the bench for preservation. Mr. A. Symon, Arbroath, presided, and referring to the advertisement which had appeared inviting tenders, said it was most unusual. Mr. P. H. Thoms said it would be undignified to answer such an advertisement, and he advised that the members should pay no attention to it. By others present objection was taken to the advertisement inasmuch as it asked for tenders from architects and others, and that the "others" might refer to apprentice joiners or masons, who might have a little skill in drawing and measuring, and that architects should take care not to allow themselves to be brought down to the level of non-professional men. Mr. Charles Ower said he had consulted a solicitor, and as a result he considered the calling of that meeting entirely illegal, because the Council of the Institute could only deal with such matters as afforded facilities for the study of the fine arts, &c. On its being explained that plans were at present being provided by an outside party to the licensed victuallers at 10s. 6d., a proposal was made that the architects should offer to do the work for 9s. 6d. This, however, did not find favour, a number of the members urging that the scale of fees existing should be adhered to, and ultimately a proposal was carried for the fixing of special fees for licensed premises plans, and for the submitting of these to the licensed victuallers for consideration.

EDINBURGH ARCHITECTURAL ASSOCIATION.—A meeting of this association was held on Dec. 16 at 117, George-street, Mr. A. H. Crawford, F.R.I.B.A., president, in the chair. Mr. W. E. Snell, of the Garden Association, read a paper on "The Objects of the Garden City Association." Mr. Snell, in the course of his remarks, pointed out that migration to new towns would relieve the congestion in the old, and that in the garden city, which would be planned scientifically from the first, there would be cheap sites and space for gardens and farms. The garden city would give opportunities for the revival of agriculture, and would also afford healthy recreations in connection with the problems of drink and gambling. The lecture was illustrated with lantern slides.

"ELECTRIC LIGHT SUPPLY AND PRECAUTIONS AGAINST FIRE."—At the last meeting of the Insurance Society of Edinburgh, Mr. Henry R. L. Burn, of the North British and Mercantile Insurance Company, read a paper on "Electric Light Supply and Precautions against Fire." The president of the society, Mr. David Deuchar, occupied the chair. Mr. Burn traced in a practical manner an installation from the mains, through the wiring, to the lamps, radiators, and motors. Overhead wires, he said, were a source of danger, and with regard to the incandescent lamps, care must be exercised in placing them near combustible materials. In warehouses, &c., wire guards should be placed over them. He had seen them placed on the top of goods in shop windows, and it might be advantageous if in fire policies a restriction was made that they should not be put nearer the goods than 3in., especially if the goods were cotton. He emphasised the necessity of installations of electricity being carried out by first-rate firms, for if they were to believe the assessor's reports, "scamping" must be accountable for many of the fires, as they found it reported that the cause of fire in many cases was through defective insulation. In conclusion, Mr. Burn gave particulars of losses which had been incurred by fires, many of which had peculiar origins. In one case, he mentioned that owing to the wind swaying a ball lamp, the coil became frayed, and damage to the extent of £8 was done. He cited a case in which £1,100 damage had been done to a church, and stated that buildings which were not frequently tenanted should be fitted with some automatic arrangement which would give warning when necessary.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.—A meeting of this society was held on the 12th inst. at the society's rooms, Park-street, Leeds, when Mr. J. B. Mitchell Withers gave a lecture

on "Sir Christopher Wren: His Time and his Works." The lecturer dwelt upon the unique opportunity which the Great Fire of London presented to an architect of genius. In Evelyn's "Diary" we learned that the author submitted a plan for the improvement of London within two days of the extinction of the fire, but Wren had been before him. The scheme met with the King's approval, but, unfortunately, and to the kingdom's loss, it was never adopted. Wren had previously been appointed assistant Royal architect, and he then had occasion to report upon the old cathedral of St. Paul's, which had recently been repaired by Inigo Jones. A renewal of the fury of the flames, brought about by a big gale, resulted in the demolition of the old cathedral, and thus it was that Wren came to have the designing of the new edifice. Mr. Withers then proceeded to tell of how Sir Christopher Wren, in face of much hindrance and opposition on the part of the Commissioners of St. Paul's, succeeded in the erection of a cathedral, the pride of all Englishmen. Perhaps the only wise thing the Commissioners did in treating with Wren was when at the commencement of the undertaking they told him to submit a design for a cathedral which he thought suitable to the site and worthy of the position, and that they would then have to see about the money. After commenting upon the distinctive style of Wren, as revealed in St. Paul's, and touching upon some of the criticisms passed upon the innovations he introduced into the architectural construction of the building, the lecturer went on to describe the way in which Wren suffered at the hands of the Commissioners. One of Wren's foremost ideas was to leave the view of the high altar unobstructed from the western end of the cathedral; but this was prevented from being realised by the building of the organ at the entrance of the choir. It was also his desire to see the interior of the dome decorated with mosaics, and to this end he made elaborate inquiries as to suitable marble and qualified artists and workmen. His labours were, however, set at naught by Commissioners, who instructed Sir John Thornhill to paint the inside of the dome. Perhaps the greatest annoyance which he suffered, however, was in connection with the balustrade. The Commissioners suggested that a balustrade would be necessary, but although Wren was sternly opposed to the idea, the balustrade was designed and erected. The numerous other churches and public buildings in London which Sir Christopher Wren designed were also described by the lecturer, who was aided by numerous old engravings, prints, maps, and plans. The lecturer was accorded a hearty vote of thanks, on the motion of Mr. R. P. Oglesby, seconded by Mr. H. S. Chorley, and supported by the president (Mr. Butler Wilson).

MANCHESTER SOCIETY OF ARCHITECTS.—The fortieth annual dinner in connection with the Manchester Society of Architects took place last week at the Queen's Hotel. Mr. J. W. Beaumont, the president, was in the chair. The president proposed "The Royal Institute of British Architects." Mr. Aston Webb, R.A., President, responded. He referred, in sympathetic terms to the retirement, through ill-health, of Mr. Alfred Waterhouse, a past president of the Manchester Society. He remarked that the previous day he had received the diploma, and had entered into full membership of the Royal Academy, and though he appreciated the honour very much, yet he grieved very much to think that Mr. Waterhouse had had to resign, and that it had fallen to his (Mr. Webb's) lot to take his place. The Institute hoped to assist in the co-ordination of the educational establishment, not only in London, but throughout the country, and he asked for their hearty assistance. Mr. Alfred Darbyshire proposed "The Manchester School of Architecture." During the two years of his office, he said, he had taken an active part in the establishment of the chair of architecture in the University. For two years they struggled very hard, and had many difficulties to contend with in the accomplishment of the objects; but it was a source of satisfaction to them that they had succeeded, and in Manchester they had now got a complete institution for the education of the architect. Mr. Thomas Kay, in responding, referred to the growth of architecture in Manchester, and he thought that they need not be ashamed of their progress. Professor S. Henbest Capper also responded in a humorous and interesting speech. He said it was not the fog that attracted him to Manchester from

Canada, with its bright sun and its cheerful cold, but he came full of hope, and exceedingly grateful to the Manchester Society of Architects for the good work that it had done in the cause of architectural education. He supposed some people would think now that they had got a professor of architecture all the buildings in Manchester would be beautiful. Some students got on without professors, but they all became architects. "The Architectural Association" was proposed by Mr. John Ely, and responded to by Mr. Henry T. Hare, President of the Association. In responding to the toast of the "Allied Societies," proposed by Mr. P. S. Worthington, Mr. Butler Wilson (president of the Leeds and Yorkshire Architectural Society) said the architectural profession should no longer be a dumping-ground for those who were unfit or unwilling to properly qualify themselves for other recognised professions. Other toasts followed.

ROYAL INSTITUTE OF ARCHITECTS OF IRELAND.—The annual general meeting of the Institute of Architects of Ireland was held on Thursday, the 17th inst., at the Institute rooms, 20, Lincoln-place, Dublin, Mr. George C. Ashlin, F.R.I.B.A., president, in the chair. The hon. secretary read the annual report of council, which stated that the year had not been marked by any very great activity in the building trade. The council, however, has had under consideration several questions of great professional importance. The question of the revision of the conditions of contract now generally in use has occupied the attention of the council and the professional practice committee at frequent meetings during the year. They hoped that this very difficult question would be settled in a satisfactory and equitable way to all concerned. At an early stage in the session a deputation was received by the council from the Architectural Association of Ireland, who, feeling that their effort to improve the educational advantages open to students of architecture in Dublin by lectures, by classes, and by prizes, lacked the stimulus of a definite aim, proposed that the Institute should enact that for the future an examination should be held by the Institute in general education and professional efficiency, and that the passing of such examination should be made a condition precedent to election. The proposal, if adopted, would introduce a radical change in their constitution, and require the creation of an examining body with considerable machinery for the exercising of its functions. The council had given this question careful attention. Such a radical change would need the consent of the Royal Institute of British Architects, with which body the Institute of Ireland was allied, and it was not at all evident that they would permit them independently to hold such qualifying examinations. The attention of the council had been directed to several unsatisfactory conditions of competition issued to the profession during the year by public bodies, and had found it necessary to urge their members to refrain from taking part in these. Mr. W. Kaye Parry moved the adoption of the report, which was seconded by Mr. J. Rawson Carroll, and carried unanimously. On the motion of Mr. A. E. Murray, seconded by Mr. W. M. Mitchell, the treasurer's report was adopted. It stated that the total income of £538 14s. 8d. received during the past four years had exceeded the total expenditure of £533 9s. 5d. by £5 5s. 3d. The President declared the following nine members elected as members of council for the coming year: Sir Thomas Drew, W. M. Mitchell, W. Kaye Parry, A. E. Murray, C. A. Owen, J. P. Sheridan, Frederick Batchelor, F. G. Hicks, and J. Rawson Carroll. The annual dinner of the Institute was held in the Shelbourne Hotel in the evening. The President, Mr. Geo. C. Ashlin, occupied the chair.

THE SOCIETY OF ENGINEERS.—At the 49th annual meeting of this society, the following were elected by ballot as the council and officers for 1904:—President, Mr. David Butler Butler; vice-presidents, Messrs. Nicholas J. West, Maurice Wilson, and R. St. George Moore; ordinary members of council, Messrs. Joseph Bernays, George A. P. Cuxson, G. A. Goodwin, William H. Holtum, Henry Sherley-Price, Edward J. Silcock, Joseph W. Wilson, and George Green; honorary secretary and treasurer, Mr. George Burt; honorary auditor, Mr. Samuel Wood, F.C.A. The president announced that the following premiums had been awarded by the council for papers read during the past session:—The president's gold medal to Mr. Douglas Mackenzie for his paper on "Motor Transport for

Goods"; the Bessemer premium of books to Mr. Robert J. Thomas for his paper on "Road Maintenance and Administration"; and a Society's premium of books to Mr. Albert Gay for his paper on "Mechanical Stokers for Electricity Generating Stations."

ARCHÆOLOGICAL.

THE CAERWENT EXPLORATIONS.—A second large tessellated pavement from the Roman excavations at Caerwent, near Newport (Mon.), has been fixed in position in the museum of the Newport Free Library. It was found in what is known as House No. 7, from which the first was taken, and the two together form one of the most important discoveries of the kind yet made in Roman remains in England. Busts of the seasons and figures of animals and cupids are conspicuous objects in the pavements. The chief features of House No. 7 were a small, partially detached building, which may have been a shrine, and two rooms separated, no doubt, only by a curtain when the house was in use. It was these rooms that contained the tessellated pavements. One underlay the other, and the upper one was of later date and of inferior workmanship to the other. Drawings and tracings of both pavements were made, and both have been in sections, imbedded in cement, and put together again in the museum. In both the rooms of House No. 7 the walls were standing to a height of 3ft. above the floor level, and the plaster on them was nearly intact. It was, therefore, possible to recover to a considerable extent the colour and design of wall decoration.

CHIPS.

The War Office has agreed to purchase from the Duke of Buccleuch, at a price to be fixed by arbitration, 25,000 acres of land to be added to the Scottish military camp near Hawick.

Messrs. Hughes and Lancaster, of Westminster, have just obtained the contract for the complete drainage of Oporto on the separate system. The town is situated on the steep northern bank of the Douro, which allows of its being drained mostly by gravitation. The contractors have undertaken to complete the main works in the town within four years from the date of the signature of the contract.

The Provincial Government of the Province of Zealand, at Middelburg, will receive tenders for the supply of two pairs of iron gates and eight sewer-valves in the lock eastward of Sas van Gent; the upper metal construction of a drawbridge and of a fixed bridge in the road from Sas van Gent to Westdorpe, with the appertaining work. Estimated value of the work, 184,500fl. (£15,375) in all.

A peal of six new bells is being placed in St. John's Church, Roughton, Mossley. The bells are the gift of the late Miss Bradbury, who left £900 for the purpose and for a stained-glass window.

The waterworks undertaken at Wentwood by the town council of Newport, Mon., have thus far involved an outlay of £374,801. The works have advanced so much that it has been decided to sell the greater part of the plant by auction next month.

A new church is about to be built on the site of 201, Balham High-road, S.W., from plans by Mr. J. L. Gibson.

The Johannesburg Town Council have just recently passed plans for 103 buildings, the estimated cost of which is £74,714.

The new tower which has just been added to St. Margaret's Church, Arbroath, N.B., was formally dedicated last week.

The long-standing dispute between the Ballachulish Slate Quarrying Company and their workmen has at last been settled, on terms satisfactory to the men. The quarry has been closed for about a year, but the men found employment elsewhere.

The Local Government Board, after reconsidering the application of the Gloucester City Council for sanction to borrow £2,000 for the purpose of de-fraying their share of the cost of reconstructing the Sudbrook Culvert, have given the required consent.

The new church institute and schools at Crook, Co. Durham, have been formally opened by Sir David Dale. They comprise a large hall, with two ante-rooms, and face the south side of the Market Place. The cost has been £11,600.

There has recently been erected in the Southampton Cemetery a memorial to the late Mr. T. G. Rooper, H.M. Inspector of Schools. It consists of a massive cross resting on a rustic base, and is a modification of the celebrated ancient cross at St. Colum's Major, in Cornwall. The memorial, which is constructed of unpolished grey granite, has been designed and erected by Messrs. Garret and Haysom, of Southampton.

Engineering Notes.

MERSEY DOCK DEVELOPMENTS.—At the Mersey Docks and Harbour Board's final meeting for this year, Mr. Robert Gladstone, the chairman, reviewed the board's work, pointing out that great progress had been made in the construction of new and the extension of existing docks and widening of dock entrances. These schemes were necessary owing to the increased trade of the port and the greater size of steamers. One of the graving docks now in course of construction, 800ft. long by 100ft. wide, would have the largest dock gates in the world. A river wall and graving-docks were in course of construction at Tranmere, on the Birkenhead side of the river, embracing an area of 62 acres.

ROWNHAM, BRISTOL.—Messrs. Lysaght and Sons, Ltd., recently secured the contract for the steelwork of the new railway and highway bridge over the Avon above Rownham, and that important undertaking will soon be completed. The masonry and woodwork of the piers have been already carried out, and a great deal of work has been done on both sides of the river in the formation of approaches. The supposition, made years ago when the enterprise was launched was that the expenditure would be about £36,000. The bridge is one with two platforms, the lower for the Great Western Railway and the upper for the general public, and the arrangement was that the company should pay half the cost. That agreement found expression in the Act of Parliament in figures under which the G.W.R. were rendered liable for £18,000 only. It now appears that the cost will approximate £70,000.

A Bill has been deposited in the Private Bill Office of the House of Commons, which seeks the sanction of Parliament to the construction of a railway under the Thames between North and South Woolwich. The length of the proposed railway will be a little more than three-quarters of a mile, commencing in North Woolwich, near Francis-street, and terminating in South Woolwich, near Beresford-street. It is proposed to work the railway by electricity from a generating station on the north side of the river.

At Chirk, Denbighshire, on Saturday, the new parish-hall, erected as a Coronation and Victorian memorial, was formally opened. The building comprises an assembly-hall to accommodate 600 persons, together with retiring-rooms. To the front are library, reading-rooms, secretary's office, and other accommodation. On the first floor are council chambers and technical classrooms. The building, which cost £5,000, is in the Jacobean style.

Colonel A. G. Durnford, R.E., Local Government Board inspector, held an inquiry at Doncaster, on Friday, as to an application by the corporation to borrow £9,920 for the electricity undertakings.

New co-operative premises in Edward-street, Winsford, were opened last week. The erection of the new shop was carried out by Mr. W. Carter, the architect and clerk of works being Mr. Thos. Dutton. The new premises have a frontage of 40ft., and at one end is a flour-room, 16ft. by 8ft., fitted with patent dust and vermin-proof flour-bins and shoots. On the story above there is a warehouse, 51ft. 6in. by 15ft. 6in.

The borough magistrates of Falkirk made a final inspection on Friday of the Grand Theatre and Opera House, which has been erected in Vicar-street, and at a subsequent meeting licensed it as a place of public entertainment. The theatre is seated for 2,000 people.

At Christ Church, Albany-street, St. Pancras, on Friday, a memorial window and tablet to the late Bishop of St. Alban's, Dr. J. W. Festing, subscribed for by members of the congregation, were formally dedicated by the Bishop of Colchester.

At the last meeting of the town council of Southampton the town clerk reported the receipt of the formal sanction of the Local Government Board to the borrowing of £12,500 in reference to the completion of the Housing of the Working Classes scheme.

Mr. Edward Smith (chairman of the Fire Brigade Committee of the London County Council) opened on Saturday afternoon a new fire station in Mitcham-lane, Streatham. The tender of Messrs. Potter Brothers, amounting to £10,000, was accepted for this station, and the buildings have been put up under the supervision of Mr. W. E. Riley, the superintending architect to the London County Council. The station has cost, including £2,000 for the freehold, £12,000. There are twelve sets of quarters, and accommodation for eleven men and a station officer, besides stables containing four stalls.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, Clement's House, Clement's Inn Passage, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED.

Telegraphic Address:—"Timeserver, London."

Telephone No. 1633 Holborn.

NOTICE.

Bound copies of Vol. LXXXIV. are now ready, and should be ordered early (price 12s. each, by post 12s. 10d.), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XLI., XLVI., XLIX., LI., LXXI., LXII., LXIV., LXV., LXVI., LXVII., LXVIII., LXIX., LXXI., LXXII., LXXIII., LXXIV., LXXV., LXXVI., LXXVII., LXXIX., LXXX., LXXXI., LXXXII., and LXXXIII. may still be obtained at the same price; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Handsome Cloth Cases for Binding the BUILDING NEWS, price 2s., post free 2s. 4d., can be obtained from any Newsgate, or from the Publisher, Clement's House, Clement's Inn Passage, Strand, London, W.C.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.). To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Situations and Partnerships.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" and "Partnerships" is ONE SHILLING FOR TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

* Replies to advertisements can be received at the office, Clement's House, Clement's Inn-passage, Strand, W.C., free of charge. If to be forwarded under cover to advertiser an extra charge of Sixpence is made. (See Notice at head of "Situations.")

Rates for Trade Advertisements on front page, and special and other positions, can be obtained on application to the Publisher.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

RECEIVED.—A. and L.—R. K. E.—Relln.—H. P. A.

Correspondence.

THE R.I.B.A. AND REGISTRATION.

To the Editor of the BUILDING NEWS.

SIR,—Will you kindly allow me, through your columns, to draw the particular attention of such of your readers as are Fellows or Associates of the R.I.B.A. to the notices of motion (of which copies are inclosed), given by myself and others, for the business meeting to be held on Monday, Jan. 4? The matters upon which a direct vote is sought are of such vital importance that I need hardly apologise for asking that every member who can possibly do so should attend that evening and record his vote either one way or the other.—I am, &c., G. A. T. MIDDLETON.

19, Craven-street, Strand, W.C., Dec. 18.

NOTICES given for the R.I.B.A. Business Meeting, to be held on Jan. 4, 1904, by G. A. T. Middleton and others:—

1. To move: That this Institute is in favour of the general principle of the compulsory Examination and Registration of Architects.

2. To move: That a committee be appointed to consider what steps should be taken to give effect to this principle, and to report thereon to a special general meeting before the opening of Parliament.

3. To nominate this committee.

LEGAL INTELLIGENCE.

LONDON WATER ARBITRATION.—At Monday's sitting, the Court made its award in the case of the Grand Junction Water Company, whose claim was £4,863,195, while the Water Board had offered £1,500,000. The arbitrators awarded £3,319,500, to be increased to £3,552,500 if their ruling of the sinking fund is held to be wrong. The case for the Water Board in reply to the West Middlesex Company was then concluded, and the Court gave its decision in this case also, awarding to the company, which claimed £4,305,245, a sum of £3,524,000. The Court adjourned to January 18.

WHAT IS A WAREHOUSE?—**GREEN V. BRITTEN AND GILSON.**—In the Court of Appeal judgment has been given by the Master of the Rolls and Lords Justices Mathew and Cozens-Hardy in an appeal from a decision by Judge Addison, K.C., sitting at the Southwark County-court, under the Workmen's Compensation Act, 1897. The applicant for compensation was a workman in the employment of the respondents, Messrs. Britten and Gilson, oil and colour merchants and dealers in glass. The respondents had a shop in Union-street, Southwark, and on the opposite side of a narrow street they occupied two railway arches in connection with their business. These two arches communicated with each other, and there was an underground passage leading from the shop to one of the arches, which was used as a lead and glazing shop. The other arch was used for storing cases of heavy glass. The glass was stored there and polished. The respondents' business was conducted in the shop, and the glass from the plate glass arch was either supplied to the shop for customers giving their orders there or was taken away direct from the arch by the respondents' carts when the orders were given to the respondents' travellers. Customers did not go into the arch, where there was no buying or selling. The shop was supplied from the arch. The main part of the business was of a wholesale character, the retail part being a small part of it. The applicant was on the day of the accident employed in loading and unloading cases of glass in the plate arch when three cases fell upon and injured him. The applicant took proceedings to have compensation assessed under the Workmen's Compensation Act, 1897, contending that the arch was a "warehouse," and therefore a "factory," within the meaning of section 7 of the Act. The County-court Judge held that the plate arch was used, and only used, as a storeroom, and that it was not a "warehouse" within the meaning of the Act. He accordingly dismissed the application for compensation. The applicant appealed. Mr. Blackwell and Mr. O'Connor, for the workman, contended that this arch was a "warehouse" within the meaning of section 7, subsection 2, of the Workmen's Compensation Act, 1897, and therefore a "factory" within the Act. Whether a place was or was not a "warehouse" was a mixed question of law and fact—"*Hoddinott v. Newton, Chambers, and Co.*" (1901), and in this case the County-court Judge misdirected himself. There was no definition of "warehouse" in the Act, and therefore the word must be construed in its ordinary and popular signification—"*Haddock v. Humphrey*" (1900). They referred to "*Wilmott v. Paton*" (1902), "*Burr v. Whiteley*," and "*Watson v. Cotton*." Mr. Shakespeare, for the respondents, contended that the arch was not a "warehouse" within the Act. The arch was merely used as ancillary to the business carried on in the shop. The case was covered by "*Burr v. Whiteley*." In order to make a place a "warehouse" it must be used as a warehouse for storing goods. The case of "*Colvius v. Anderson*," in the Court of Session, was directly in point. The Court allowed the appeal. The Master of the Rolls said that the question was whether the building in which the accident admittedly occurred was a "warehouse" within the meaning of the Workmen's Compensation Act, 1897. So far as the wholesale trade was concerned, the store fulfilled all the purposes of a warehouse. The respondents had also a retail business, which, however, formed but an insignificant part of the whole business. The County-court Judge came to the conclusion that this was not a warehouse. It was exceedingly difficult, by reason of the course which the decisions had taken, to mark out the line which separated that which was a warehouse from that which was not. The decisions had gone a long way. They had excluded certain lines of definition of what was and what was not a warehouse. In a recent case of "*Hunt v. Grantham Co-operative Society*" (1902), a line of demarcation was laid down by Judge Wightman Wood—namely, that where the store was merely ancillary to a retail shop it was not a warehouse, as neither shops nor shopkeepers were brought within the Act. This Court adopted that principle in "*Burr v. Whiteley*," and laid it down that large receptacles used for storing goods which were kept for the purpose of sale in a retail shop were not warehouses within the meaning of the Act. Now they came to a case which seemed to combine both attributes. A wholesale business was carried on, while at the same time a small retail

business was carried on in the shop. Looking at the whole of the facts, this arch was used almost entirely for the purposes of the wholesale business, and in his (the Master of the Rolls's) opinion the learned County-court Judge misdirected himself in saying that, if the store was ancillary to the business carried on in the shop, it was not a warehouse within the meaning of the above decisions. If this store was ancillary to a wholesale business, it was a warehouse. If it was ancillary to a retail business, it was not a warehouse. It seemed to him that the County-court Judge had misdirected himself in point of law. The County-court Judge was too strict in the application of the principle laid down in the case of a storeroom being ancillary to a retail business. In the present case the storeroom was ancillary to the wholesale trade, and was therefore a "warehouse." The appeal must therefore be allowed. Lord Justice Mathew was of the same opinion. Lord Justice Cozens-Hardy said that he had some doubt in this case, but it was not strong enough to make him dissent from the conclusion arrived at by the Master of the Rolls and Lord Justice Mathew.

PRIVATE STREETS WORKS APPEAL.—**WAKEFIELD CORPORATION V. COOKE AND OTHERS.**—In the House of Lords, the judgment has been given by Lord Chancellor, Lords Macnaghten, Shand, Davey, Robertson, and Lindley in the case of "*Wakefield Corporation v. Cooke and Others*." An appeal from an order of the Court of Appeal (Lord Justice Vaughan Williams, Stirling, and Mathew) dated February 3, 1903, which reversed an order of the King's Bench Division (Lord Alverstone, Chief Justice, and Justices Darling and Channell) dated December 16, 1901. The respondents were owners of premises fronting Sludge-lane. By the Wakefield Corporation Act, 1887, Part IV., sections 27 to 45 inclusive, the appellants obtained power to deal with private street works within the city. The provisions of the said Act are (*mutatis mutandis*) identical with the provisions of the public Act intitled the Private Street Works Act, 1892. The appellants by resolution determined to exercise in relation to part of Sludge-lane the powers conferred upon them by the Act of 1887, and by a further resolution of March 9, 1897, they approved a specification of the private street works required to be carried out therein, together with the plans and sections of such works, the estimate of the probable expenses thereof, and the provisional apportionment of the estimated expenses among the premises liable to be charged therewith, which had been prepared by the city surveyor in accordance with the instructions given to him. The resolution was duly published, and was served on the owners and occupiers of Sludge-lane, most of whom were respondents. In accordance with the provisions of section 30 of the Act, most of the owners and occupiers served upon the appellants notices objecting to the proposals of the appellants, on the ground "that Sludge-lane is a highway repairable by the inhabitants of the city of Wakefield at large." The respondents' objections were heard by three justices for the city on Jan. 6, 1893, and the justices made an order whereby they determined that the objection "that Sludge-lane is a highway repairable by the inhabitants of the city of Wakefield at large" was a good and valid objection. This order had not been appealed against, and was still in full force and effect. In November, 1900, the appellants by resolution determined to exercise the powers conferred upon them by the Act of 1887 in relation to the same part of Sludge-lane which was the subject of their previous resolution of March 9, 1897, but with an additional length of 80 yards in a straight line, and continuous therewith. This addition was throughout treated as immaterial. By a further resolution of February 12, 1901, the appellants approved a specification, plans, and sections of such works. The appellants published this resolution and served notices thereof on the owners of the premises pursuant to the provisions of section 29 subsections (2) and (3) of the Act of 1887. In accordance with the provisions of section 30 of the Act, most of the persons liable to be charged under the resolutions of February 12, 1901, served upon the appellants notices objecting to the proposals of the appellants on the ground "that Sludge-lane was a highway repairable by the inhabitants of the city of Wakefield at large," the respondents the County Council for the West Riding adding to their objection that the same had been previously so found by the justices for the city of Wakefield at a Court of summary jurisdiction held at Wakefield on January 6, 1893. The objections were heard by four justices for the city on July 25, 1901, who determined that the objection "that Sludge-lane is a highway repairable by the inhabitants of the city of Wakefield at large" was the same objection as was decided on January 6, 1893, and the justices declined to hear any evidence or to go into the merits of the objections. A special case was stated for the opinion of the King's Bench Division, and their lordships were of opinion that the reasoning of the Court of Appeal in the case of "*The Queen v. Hutchings*" applied to this case, and that, therefore, the objections taken on behalf of the objectors that there had been a previous determination that

the street in question was a highway repairable by the inhabitants of the city at large was no bar to the proceedings taken in this case. The Court therefore ordered that the judgment of the justices of July 25, 1901, should be reversed, and the matter remitted to the justices to proceed with the hearing. The Court of Appeal, however, held that the finding of the justices on January 6, 1893, was conclusive evidence in any Court into which it came of the matters therein stated, and if not in form called a judgment *in rem* was at all events in all its essentials a judgment *in rem*, and that the decision in the case of "*The Queen v. Hutchings*" did not require the justices sitting on July 25, 1901, to inquire again into the merits, and the Court therefore allowed the appeal of the respondents and reversed the order of the King's Bench Division. The Lord Chancellor, in moving that the appeal should be dismissed, said that the case was doubtless one of local importance; but the matter became clear if one compared the 150th section of the Public Health Act, 1875, with the provisions of the local Act. By the Public Health Act all streets were within the jurisdiction of the urban authority. Then by section 150 the urban authority could require any street—the distinction of public and private streets being made for convenience—to be properly sewered, levelled, paved, metalled, flagged, or channelled, and also lighted. If the owners of the private street did not comply with the orders of the urban authority, the latter could do the work themselves and enforce payment of the cost of executing the work. The case of "*The Queen v. Hutchings*," which was relied upon by the appellants—with which his Lordship respectfully concurred—had no application to the present appeal. In that case the magistrates exceeded their jurisdiction, because they dismissed an application for the recovery from the owner of the expenses of sewerage of a street on the ground that the street was a public highway repairable by the inhabitants at large. But the machinery of the statute involved here was different. By section 30 of the Wakefield Corporation Act, 1887, the proposals of the corporation could be objected to by the owners on the ground among others "that a street or part of a street is (in whole or in part) a highway repairable by the inhabitants at large." This question was, under the Act of 1887, one for the justices, and was submitted to them for their determination, and was finally settled in January, 1893, and could not now be reopened. In effect that decision was a judgment *in rem* on the status of the street. He was disposed to agree with Lord Justice Vaughan Williams that this procedure was introduced by reason of difficulties arising under the Public Health Act, 1875. Lord Macnaghten and Lord Shand concurred. Lord Davey dissented from the view of the case taken by the Lord Chief Justice. In his opinion the primary, and not, as the Lord Chief Justice held, merely the incidental, duty of the Court of summary jurisdiction was to hear and determine objections. This showed the distinction between the present case and "*Reg. v. Hutchings*," in which Lord Selborne and his colleagues in the Court of Appeal held that the first order of the justices was beyond their jurisdiction, and did not constitute *res judicata* in respect of the later application. He agreed with the Lord Chancellor that there was here in effect, if not strictly, a *res judicata*. Lord Robertson said that he had at first shared the doubts expressed below by Lord Justice Stirling, but had been convinced by the arguments of Mr. Danckwerts. Lord Lindley concurred.

NEGLECT TO MAKE-UP ROADS.—**ATTORNEY-GENERAL V. S. WHEATLEY AND CO.**—Mr. Justice Joyce, sitting in the Chancery Division, has heard a motion to commit two directors of the defendant company to prison for not having forthwith made up Hartington-road, Chiswick, to the satisfaction of the district surveyor, pursuant to an undertaking contained in an order made in the above-mentioned action, dated July 29, 1903. The action was brought by the Attorney-General at the relation of the plaintiffs, who were the owners of houses with frontages on the road in question. The defendant company were the owners of a piece of land at the end of the road. The Hartington-road was a public road, but not repairable by the inhabitants at large. The defendant company had opened a sand-pit on their land, and used traction engines and trucks upon the road for drawing the sand. The plaintiffs alleged that this use of the road destroyed the road and was a public nuisance, and they claimed an injunction and damages. At the hearing of the action a compromise was agreed to and, upon the defendants' undertaking forthwith to make up the road to the satisfaction of the district surveyor between certain points, and upon certain other undertakings, all further proceedings in the action, except for the purpose of carrying the order into effect, were stayed. The undertaking not having been complied with, the plaintiffs moved to commit the directors for breach of the undertaking. The notice of motion was afterwards amended by asking in the alternative for an order upon the company to make up the road within three months. The defendants, the directors, alleged that they had agreed to the compromise in the belief that the cost of making up

the road would not exceed £800, of which the company was to contribute £500, whereas the cost of making it up upon the lines required by the district surveyor would be about £1,500. They further said that the company was quite unable to find the money to comply with the requirements of the district surveyor. It was contended on their behalf that no order ought to be made against them personally. The plaintiffs, on the other hand, contended that the undertaking which was given by the directors was equivalent to an order upon them, and that under the Rules of Court, order 42, rule 31, they were liable to be attached for disobedience to it. That rule provides that "any judgment or order against a Corporate body wilfully disobeyed may, by leave of the Court or a judge, be enforced by sequestration against the corporation's property or by attachment against the directors or other officers thereof, or by writ or sequestration against their property." Mr. Justice Joyce made an order upon the company to do the work within three months as asked in the amended notice of motion. With reference to the application against the directors, he said that, having regard to all the circumstances of the case, and that this was an undertaking, and not an order, he could not make any order against them under the rule in question. As against them, therefore, he refused the application, without costs; but this would be without prejudice to any application that might be made against the directors in the event of the company's not complying with this order.

ANTI-SIPHONAGE TRAPS FOR INDUSTRIAL DWELLINGS.—**METROPOLITAN INDUSTRIAL DWELLINGS COMPANY V. LONO.**—In the King's Bench judgment has been delivered by the Lord Chief Justice, Mr. Justice Lawrence, and Mr. Justice Kennedy in this action, a case stated on the application of the defendant company by Mr. Chapman, police magistrate, at the Southwark Police-court, in the matter of 33 summonses taken out on behalf of the Southwark Borough Council against the appellants, the owners of Ponsonby Buildings. The magistrate said the defendants were the owners of Ponsonby Buildings Industrial Dwellings, erected before the confirmation of the drainage by-laws of 1901, made under section 202 of the Metropolitan Management Act, 1855; and in December, 1902, owing to the substitution of an iron pipe or drain for one of ordinary Doulton ware, they found it necessary to put new traps and pans connected with 33 water-closets in their buildings as the old traps and pans were broken during the progress of the work, but there was no change in the upright soil-pipe. They were then informed by the local authority that these new traps must be fitted with anti-siphonage pipes, in accordance with by-law 17 of the London County Council drainage by-laws, because, by by-law 21, the by-laws were made applicable to new work in old buildings as far as practicable. The defendants refused to comply, on the ground that these by-laws were not applicable, and were unreasonable; and it was now further contended that they were *ultra vires*. The local authority thereupon took out 33 summonses for non-compliance in the case of each of the 33 closets, in order that these questions might be settled in a court of law. The defendants, in order to support their contention as to the unreasonableness of the by-laws, called evidence that the soil pipes were of such dimensions—namely, 5in. in diameter—that the evils of siphonage, to prevent which these by-laws had been made, would not possibly occur, and that the expense which must be entailed by compliance with the by-law was so great as to make the application impracticable. Mr. Dodd, for the local authority, contended that he had no right to consider any questions except the application of the by-law and its practicability. He had with some hesitation come to the conclusion that this contention was right. The by-laws admitted of no exception for the case of new buildings which contained a system of drainage where there was no probability of siphonage, and he did not think he was at liberty to create such an exception in the case of old buildings, to which the by-laws applied. If this were possible a dispute might be raised on each case, and the by-laws rendered practically valueless. He set aside, therefore, the question of whether the by-law was necessary, or even useful in this particular case. Then, as to its practicability, he did not think there was any evidence that compliance with the by-law was not practicable. The figures given for the probable expenses went far beyond this case, and he did not consider they ought to affect his judgment. The words "so far as practicable," in his opinion, were intended for cases where large structural alterations or demolition of buildings would be necessitated by the application of the by-law, which was not the case here. He thought, therefore, that the application was practicable. He also considered that the work done involved the application of the by-laws to these traps. Mr. Dauckwerts, K.C., contended that the work must involve a reconstruction of the rooms in which the water-closets were placed, or, at any rate, of the system of water-closets; but he thought the words used in by-law 21 were intentionally wider than that, and specifically applied to every

trap or apparatus connected with a pipe or drain. Two other questions remained: Were these by-laws under section 202 *ultra vires*, and were they unreasonable? On the first he was distinctly of opinion that they were not *ultra vires*. As to the second question, if he felt justified in pronouncing an opinion as to the reasonableness of the by-law as applied to this building, he should have great hesitation in deciding the case. He did not, however, feel so justified; but, generally, he could not doubt that it had been made by the London County Council and approved by the Local Government Board for good cause. In these circumstances he could not hold that they were unreasonable, though he regretted there was no proviso for the case where it was proved that there was practically no danger of siphonage. There were other dangers, no doubt, connected with pipes of too large a diameter, and it might be that the authorities felt that the only safe way of dealing with so difficult and dangerous a matter was by such a hard-and-fast rule, and so long as it existed the local authority was bound to enforce it. He had no alternative but to convict the defendants; and there would be a fine of 40s. and £10 10s. costs on each of the others. In reply to an application on behalf of the defendants, Mr. Cecil Chapman agreed to state a case. The Lord Chief Justice, in giving judgment, said that these by-laws ought to be supported, except in a very clear case of their being unreasonable, or of their not covering what was complained of, particularly when they were sanitary by-laws, for it was important that the local authority should be supported. For that reason he rejected the implied argument that, because there was an existing system of ventilation, the magistrate should have taken that into consideration. The magistrate found in favour of the appellants that there was very little chance of siphonage or regurgitation, but that was *nil ad rem*. The only thing he had to consider was whether there was a breach of the by-laws as properly construed. His Lordship considered that there was power to make these by-laws under section 202 of the Act of 1855, and these general powers ought to be construed liberally. These by-laws were in no sense *ultra vires*, and that issue tended to divert the mind from the judicial consideration of their proper construction. It was only in strong circumstances that a by-law ought to be held to be unreasonable, and these by-laws were neither unreasonable nor *ultra vires*. All they had to do with was their construction, and it must be remembered that when they were dealing with penalties the proceeding was *quasi-legislative*, and there should be at least as much clearness and certainty as in statutes and provisional orders imposing penalties. A person who had to make up his mind what his duties and liabilities would be was entitled to be told in reasonably plain language what he was to do, particularly in the case of existing buildings. When by-laws were applied to old buildings, it was not putting too great a burden on the local authority to say that they must state in reasonably plain language what were the burdens put on owners. In this case, in the course of altering the drains some of the pans and traps were injured. There was no change of the upright soil-pipe. There was nothing done in the way of reconstruction except where the traps and pans were broken. The respondent contended that the by-law was to apply in a case where really there was nothing but repair of the pans and traps, and there was no reconstruction or intention to reconstruct. If a local authority desired to say that when one repaired any part of an existing closet or repaired the closet itself one was bound to remodel the ventilation, they were bound to say so in plain terms. The question was whether they had said so here. If by-law 17 had in terms said that in the case of old houses when a broken trap was repaired a certain system of ventilation must be put in, that might be a perfectly good by-law. He saw no reason why it should not. By-law 21 applied these by-laws to old buildings, and must be read most strongly against the person who was doing the work. Was it right to say that the work contemplated by that by-law must be the construction of a water-closet under by-law 17? That was going too far. But if the local authority meant to say that putting in a new trap was the construction of a water-closet, or that the doing of repairs which had been rendered necessary by some part of the closet being broken when some other work was being done, brought by-law 17 into operation, they ought to have said so in plain words. By-law 21 did not inform a person that if he repaired a trap or pan he was constructing a water-closet. Notwithstanding the difficulties arising in this case, he had come to the conclusion that the by-law was not sufficient to make that which was done the constructing of a water-closet within by-law 17, and these penalties ought not to be enforced. He did not agree that by-law 21 was *ultra vires*, but the local authority had not brought within it what was done in this case. The other learned Judges delivered judgment to the same effect, and the appeal was accordingly allowed.

A SARDINIA-STREET ARBITRATION.—The claim for £30,000 compensation by Pendarves Trustees

against the London County Council for the freehold of the premises used by the Metropolitan Electric Supply Company in Sardinia-street, Lincoln's Inn-fields, required for the new thoroughfare—Kingsway—has been settled before Mr. Under-Sheriff Burchell at the Sheriff's Court, Red Lion-square, by consent, at £24,750.

BANKS' FIREPROOF CONSTRUCTION SYNDICATE, LIMITED.—At the Board of Trade offices, Carey-street, on Wednesday, meetings of the creditors and contributors of this company were held under an order for compulsory liquidation. Mr. A. S. Cully, Assistant Official Receiver, presided. The statement of affairs showed liabilities amounting to £11,781, of which £9,990 was expected to rank, whilst the assets, valued at £1,700, were covered by debenture bonds. The company was stated to have been registered in May, 1891, for the purpose of constructing fireproof floors, and appeared to have incurred a loss of £11,000 through underestimating the cost of carrying out certain contracts and £3,000 through bad debts. Both meetings left the liquidation in the hands of the Official Receiver.

REOPENING AWARDS UNDER THE WORKMEN'S COMPENSATION ACT.—**SHARMAN V. HOLLIDAY AND GREENWOOD, LTD.**—In the Court of Appeal, on Friday, judgment was delivered by the Master of the Rolls and Lords Justices Mathew and Cozens-Hardy in this appeal from a decision of the Judge of the Lambeth County-court in proceedings under the Workmen's Compensation Act, 1897. The workman in this case met with an accident on August 16, 1901, while in the service of the employers, who were builders and contractors. The accident resulted in his being totally incapacitated for work, and on Dec. 3 a memorandum of agreement was filed in the Lambeth County-court under which the employers were to make the workman a weekly payment of 15s. during incapacity. On Dec. 11, 1902, the employers filed a request for a review of the weekly payment, on the ground that the workman was not suffering from any result of the accident, but was able to work and earn full wages. The arbitration came on for hearing on Jan. 21, 1903, when the County-court Judge reduced the payment to 1d. per week. On April 24 the workman filed a request for a further review, asking that the weekly payment might be increased to 15s. The second arbitration came on for hearing on June 23. It was contended on the part of the employers that the matter was *res judicata*. The County-court Judge asked on what new facts the applicant relied showing that his earning powers had been diminished since the hearing of the former application on Jan. 21, and after hearing such fresh evidence, his Honour held that, as he had decided on Jan. 21 that the earning powers were not at that time diminished, and as the present application was again on the ground of total incapacity, the matter was *res judicata*; and also that there were no facts alleged showing any alteration in the circumstances of the case since the hearing on Jan. 21. The applicant appealed. The Court allowed the appeal, and remitted the case to the County-court Judge. The Master of the Rolls said that in this case the County-court Judge, on an application by the employers under clause 12 of the first schedule to the Workmen's Compensation Act, made an award by which he declined to allow the injured workman a weekly payment of more than 1d. By adopting that course he kept seisin of the case. When the matter came before him again on an application by the workman to have the weekly payment reviewed, he found that no change had taken place in the condition of the man, and he refused to review the weekly payment, on the authority of "*Crossfield and Sons v. Tanian*." The question was whether the first decision of the County-court Judge governed the position of the parties for all time. He doubted whether it was right to apply the doctrine of estoppel to such a matter of opinion as the question whether a man was incapacitated for work. An opinion based on expert evidence might be displaced by subsequent experience. He (the Master of the Rolls) thought that was not a matter in which there ought to be an estoppel. The case of "*Crossfield and Sons v. Tanian*" was not a case of an estoppel on a matter of opinion. The fact that the workman had been repeatedly refused employment pointed to evidence of attempts on his part to get work and of his inability to do so. He came to the conclusion that there was a change in the circumstances which justified the County-court Judge in reviewing his previous decision. Lords Justices Mathew and Cozens-Hardy concurred.

The town of Lyndhurst is being sewered for the New Forest Rural District Council, and the works are approaching completion. Messrs. Coombes and Bennett, of Southampton, were the engineers, and Mr. Woods is the contractor.

At a meeting of the Newcastle-on-Tyne Board of Guardians, on Friday, it was agreed to accept the tender of Mr. Weatheritt, builder, Worswick-street, Newcastle (£16,127 5s. 11d.) for the rearrangement of the children's block and the provision of a visitors' waiting-room and nurses' bedrooms at the workhouse.

Our Office Table.

The joint committee of architects and surveyors who have taken in hand the reform of the law relating to Ancient Lights seem to have been badly advised as to its draughtsmanship, for the measure as published is defective in many particulars. No radical abolition of the whole complicated machinery of the accrual of easements to light in nineteen years and a day is proposed, but the reforms are restricted to two points—the substitution of a written notice of obstruction from the occupier threatened with the imposition of an easement for the present unsightly and costly hoarding, and the appointment of a tribunal of appeal composed of experts to decide all disputes of this class. In both cases, however, the promoters have blundered. There is no provision for enforcing penalties for neglect on the part of the occupier to forward such notices of obstruction to his landlord, and the tribunal's decisions in cases where the damage it assessed at over £500, are deprived of finality by the provision of an appeal to the High Court. These and other objections to the crudely framed Bill were brought out during the discussion on the subject at the last meeting of the Society of Architects, and although that organisation might have been expected to look with favour on any measure which proposes to transfer a large proportion of the fees payable in ancient light cases from the pockets of lawyers to architects, it was unanimously agreed to oppose the measure in Parliament, and to employ counsel for the purpose. Judging from the contemptuous neglect shown by the present Parliament to all measures for social reform, it will be no difficult matter to block the Bill at every turn.

The recent Chippendale Furniture case has recalled some stories about old and modern dealers' doings in passing off more or less questionable replicas of genuine examples. Among these tales few can compare with an exceedingly astute piece of business which lately took place in connection with the sale of an "exceptionally fine suite of Chippendale." The attention of a nobleman, known for his taste in these matters, was directed to the furniture in question, which he saw and purchased for £500, and had sent off to his country mansion. Shortly after, a shooting party brought down a friend who was a connoisseur to see the aforesaid purchase. He came to the speedy conclusion that several of the pieces were only very clever copies, and that though some of the furniture was genuine it was not all real Chippendale. The earl consequently reported this opinion to the dealer who had sold the goods, and in reply was told to return the suite if it did not give satisfaction, as there would be no difficulty in disposing of it at the price already paid. A cheque would be forwarded for the amount by return on receipt of the furniture. The nobleman returned the goods, saying: "I have this day sent you the furniture as arranged, and shall thank you for the cheque forthwith." The dealer sent the money and put himself into communication with an American gentleman of large means, saying: "You will see by the inclosed letter from Earl So-and-so that a very exceptional suite of fine Chippendale has come into my possession from Dry-as-Dust Castle," &c. Having thus got a pedigree for the suite, its sale at more than double the nobleman's figure was at once obtained, and no doubt whatever now remains as to its authenticity.

SIXTEEN tramway schemes have been finally sanctioned and adopted by the London County Council, and will be promoted next session. Of these the following five will not, if sanctioned by Parliament, involve any street widenings: 1, Hampstead-road to Oxford-street, via Tottenham Court-road; 2, Westminster Bridge-road to Strand, via Embankment; 3, Waterloo-road extension; 4, Grove Vale, Camberwell, to Stuart-road, Peckham; and 5, Trafalgar-road, Greenwich, to East India Dock-road, via Blackwall Tunnel. Eleven schemes are proposed which involve street widenings to be carried out with the co-operation of the borough councils concerned. These are: 6, Marble Arch to Cricklewood, via Edgware-road; 7, Clapham Common (south side) to East Hill, Wandsworth; 8, Streatham terminus to county boundary; 9, Wellhall-road from South-Eastern Railway Company's bridge to High-street, Eltham; 10, Lordship-lane to Dartmouth-road, Forest Hill; 11, Lewisham High-road to Park-road, Forest Hill; 12, New Cross-

road to High-street, Lewisham; 13, High-street, Lewisham, to Lee Green; 14, Deptford to Herbert Hospital, Woolwich; 15, Beresford-square, Woolwich, to High-street, Plumstead; and 16, High-street, Plumstead, to county boundary near Abbey-road, via Basildon-road.

THE interim report of the British Electric Traction Company states that during the present year over fifty route miles of new or reconstructed tramways or light railways have been opened for traffic by electric traction on the overhead system. Considerable progress is being made by the County Council of Middlesex, and by the Metropolitan Company, in the construction of the lines and works, and about twenty miles of lines will be opened for traffic by electricity on the overhead system early next summer. During the past Session the Company has obtained an Act of Parliament authorising the reconstruction for working by electric traction of the existing Brighton and Shoreham Tramways and extensions of the lines to Worthing, and the Company has also obtained an Act of Parliament authorising the construction of further tramways in the neighbourhood of Croydon, forming extensions of the existing Croydon Electric Tramways, thus completing a network of tramways of about thirty route miles.

AN interesting find of bronze relics has been made on the Lulworth Castle Estate, in Dorset. On one of the farms near West Lulworth there is a great drift of flints on the chalk, and the flints have been used for road metal. In the course of excavations the labourers came upon a number of bronze relics. Through the kindness of Miss Weld they have been sent to the Dorset County Museum on temporary loan. The most important object is a bronze sword, 24½ in. long, and, though broken, it is in a fine state of preservation. Other relics are a socket celt, a gold or heavily gilt bronze finger ring, a socket gouge, a hilt of a sword, an object which is believed to be one of the fittings of a car (an opinion confirmed by Mr. C. H. Read, of the British Museum), supposed harness fittings, and a bronze crook.

THE fourth annual report of the Board of Trade on their proceedings under the Conciliation (Trade Disputes) Act, 1896, has just been issued as a Blue Book. It covers a period of two years—viz., from July 1, 1901, to the end of June, 1903. During the two years covered by this report 41 cases have been dealt with, in 21 of which a cessation of work was involved. In the preceding two years there were 46 cases. The total number of cases in the period of nearly seven years which has elapsed since the passing of the Act amounts to 154. In the period dealt with in this report there were 29 cases of application from both parties, four from employers only, and eight from workpeople only. Of the 41 cases under the Conciliation Act during the last two years 16 arose in the building trades. During the whole period since the passing of the Act, 56 cases, or more than a third of the total, have been in the building trades, no other group of occupations approaching this one in the number of cases furnished. During the past two years the number of cases settled under the Act has been 29, in 13 of which a stoppage of work took place. Of the 29 cases, 27 were settled by arbitrators or umpires appointed by the Board of Trade, and two by conciliators. Four other cases were settled by the parties during negotiations by the Board of Trade, and in seven cases either the application was declined by the Board of Trade or such action as was taken did not result in a settlement. The remaining case was pending at the date of the report. Of the two cases settled by conciliators, one affected practically the whole of the building trades at Bristol. Among the 27 cases settled by arbitration were a dispute affecting carpenters and joiners at Bradford, in which 315 men struck against a proposed reduction of wages, and which was referred to arbitration after a stoppage of more than fifteen months; and another stoppage affecting builders' labourers in the Potteries and Newcastle district, about 1,000 men having their wages changed by the award. One of the four cases settled by the parties during negotiations by the Board of Trade was the dispute affecting joiners at Barrow-in-Furness.

On Christmas Day, Mr. Harry Hems is giving at the Luckie Horseshoe studios in Exeter his thirty-fifth annual feast to the poor old folk of that city who have been worsted in the battle of life, without distinction of creed or party. After dinner the Bishop and Mayor of Exeter have

promised to put in an appearance, and address a few cheery words of greeting to the assembled guests. Last year, it will be recollected, Mr. Hems was disappointed in his chef at the last moment, and the festival had to be transferred to Plymouth; this time early arrangements have been made, and the feast will once more take place in the Ever Faithful city.

CHIPS.

The movement having for its object perpetuation of "the memory of Ipswich martyrs, who for their constancy to the Protestant faith suffered death by burning," was consummated on Wednesday week by the unveiling by Dr. Wace, Dean of Caterbury, of a memorial which has been erected in Christchurch Park in that town, on the slope just above the mansion, at a point where the main roadway branches towards the Bolton-lane exit. The memorial consists of a column of stone raised on a square pedestal, and terminating in a canopied finial, the style adopted being Decorated Gothic. The shaft is of polished Aberdeen granite, and the base and canopy of Ketton stone. The memorial was designed by Mr. H. T. Edwards, and executed by the Art Memorial Company, West Norwood.

The altar tomb which has been erected this week over the grave of the late Dean Stephens in Winchester Cathedral churchyard was dedicated on Tuesday, the anniversary of the Dean's death. There has also been a memorial brass affixed in the floor of the choir of the cathedral, close to Rufus's tomb.

A meeting of the Devizes Town Council was held on Friday, when a scheme was adopted (prepared by Mr. C. E. Ponting, F.S.A.) for the decoration of the interior of the town-hall, the cost being estimated at £370.

The Carnegie free library at Littleborough, Lancs, has just been opened. The architects were Messrs. S. Duncan and Butterworth, of Rochdale.

The extension of the tramway lines of the Glasgow Corporation, measuring two miles of double track, from Union-place, near Rutherglen, to Cambuslang, has now been completed, and has been opened for traffic. The through route is from Cambuslang to Partick, via Hope-street, Bothwell-street, and St. Vincent-street.

On Friday a marble bust of the late Dr. John Manley (1827-1902), which has been placed in the central reading-room, High-street, Wednesbury, as a memorial of the services rendered to the town by him, was unveiled. The cost of the bust, which is the work of Mr. Hopkins, of West Bromwich School of Art, has been defrayed by subscriptions.

The Northern Stone Dressing Co., Ltd., has just been registered with a capital of £10,000 in £1 shares, to acquire the business and assets of the Northern Stone Dressing Co., now carried on at Byker, Newcastle-on-Tyne. The subscribers are J. J. Lish, Craiglees, Heaton-road North, Newcastle, architect; Mrs. N. B. Lish, same address; J. R. Lish, same address, quarry owner; Miss C. H. R. Lish, same address; B. B. Lish, same address; K. H. Lish, same address; Miss F. M. Lish, same address; T. T. Dunn, 21, Brook-street, Whitley Bay, stone works manager; W. M. Pybus, Post Office Chambers, Newcastle, solicitor. No initial public issues.

The new "George White" school on Silver-road, Norwich, was opened by the Mayor on Thursday in last week. The building was the last that was erected by the late School Board. Mr. C. J. Brown, of Norwich, was the architect, and Mr. T. Gill, of Rupert-street, Norwich, was the contractor. The school cost £13,800, exclusive of the site, or £13 5s. per head.

A magnificent mosaic floor has been exposed at Trier during the recent work on the canal near the Basilica. It dates from the latter half of the third century A.D.

The London County Council propose to begin early in 1904 the conversion of the Brixton and Streatham cable tramway into an electrical conduit system at a cost of £107,300.

The subject for the monthly students' competition of the Manchester Society of Architects for December has been a village school for 150 children. The prize has been awarded to Mr. T. Harold Hill.

Mr. F. H. Stevens read a paper on the "Specific Performance of Contracts" at a meeting of the Institute of Estate and Home Agents at Pagani's Restaurant, Great Portland-street, on Wednesday week, Mr. E. Pennington presiding.

New science laboratories have just been added to Ipswich School, from designs by Messrs. Bishopp and Cautley, architects, of Ipswich. The buildings form a block situated in the chapel yard, and they are detached from the rest of the premises, save for a corridor communicating with the older part of the school. The builder was Mr. W. T. Death, of Ipswich. The cost has been £1,200.
